Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004 \text{ \AA}$ ;  $R$  factor = 0.074;  $wR$  factor = 0.219; data-to-parameter ratio = 11.8.

The asymmetric unit of the potential mono-Schiff base ligand title compound,  $C_{13}H_{10}N_4$ , contains two crystallographically independent molecules, *A* and *B*. In molecule *A*, the two rings are twisted from each other by  $13.90(18)^\circ$ . By contrast, the dihedral angle between the two rings in molecule *B* is  $0.67(19)^\circ$ . In the crystal structure, molecules are linked through intermolecular N—H···N interactions via  $R_4^4(32)$  motifs, forming two-dimensional arrays. The short distances between the centroids of the six-membered rings indicate the existence of  $\pi$ – $\pi$  interactions [centroid–centroid distances =  $3.6880(17)$ – $3.7466(15) \text{ \AA}$ ].

### Comment

Schiff bases are one of most prevalent mixed-donor ligands in the field of coordination chemistry and play an important role in the development of coordination chemistry (Fun *et al.*, 2008). Structures of Schiff bases derived from substituted benzaldehydes have been reported previously (Li *et al.*, 2005; Bomfim *et al.*, 2005; Glidewell *et al.*, 2005, 2006; Sun *et al.*, 2004; Fun *et al.*, 2008).

Each imino ( $\text{C}=\text{N}$ ) functional group is co-planar with the adjacent benzene ring in (I), Fig. 1. Two independent molecules, A and B, comprise the crystallographic asymmetric unit. In molecule A, the two phenyl rings are twisted from each other by  $13.90(18)^\circ$ . The dihedral angle between the two phenyl rings in molecule B is  $0.67(19)^\circ$  which indicates the molecule is planar. In the crystal structure, molecules are linked together through intermolecular  $\text{N}-\text{H}\cdots\text{N}$  interactions via  $\text{R}_4^4(32)$  motifs to form 2-D arrays parallel to the ab-plane, Fig. 2 & Table 1. The short distances between the centroids of the six-membered rings prove the existence of  $\pi-\pi$  interactions [ $\text{Cg}1\cdots\text{Cg}4^{\text{i}} = 3.7466(15) \text{ \AA}$ , (i)  $x, 1/2 - y, -1/2 + z$ ;  $\text{Cg}2\cdots\text{Cg}3^{\text{i}} = 3.6894(14) \text{ \AA}$ ;  $\text{Cg}3\cdots\text{Cg}4^{\text{ii}}$ , (ii)  $1 - x, -y, 1 - z$ ;  $\text{Cg}1, \text{Cg}2, \text{Cg}3$ , and  $\text{Cg}4$  are the centroids of the N1A/C1A–C5A, C7A–C12A, N1B/C1B–C5B, and C7B–C12B rings, respectively.

### Experimental

The synthetic method has been described earlier (Fun *et al.*, 2008). Single crystals suitable for X-ray diffraction were obtained by evaporation of an ethanol solution of (I) held at room temperature.

### Refinement

The hydrogen atoms of the amino groups were located from the difference Fourier map and refined freely. The remaining hydrogen atoms were positioned geometrically and refined using a riding model with  $\text{C}-\text{H} = 0.93 \text{ \AA}$ , and with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{H})$ .

### Figures

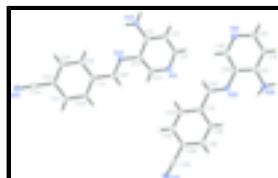

Fig. 1. The molecular structure of (I) with atom labels and 50% displacement ellipsoids for non-H atoms.

Fig. 2. The crystal packing of (I), viewed down the  $c$ -axis showing a part of the 2-D array and  $\text{R}_4^4(32)$  ring motifs. Intermolecular hydrogen bonds are shown as dashed lines.

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.074$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.219$	$w = 1/[\sigma^2(F_o^2) + (0.1298P)^2 + 0.1507P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\text{max}} < 0.001$
3810 reflections	$\Delta\rho_{\text{max}} = 0.63 \text{ e \AA}^{-3}$
323 parameters	$\Delta\rho_{\text{min}} = -0.29 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Experimental.** The low-temperature data was collected with the Oxford Cyrosystem Cobra low-temperature attachment.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
