Received 30 October 2008; accepted 14 November 2008

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  $R$  factor = 0.035;  $wR$  factor = 0.099; data-to-parameter ratio = 15.6.

The title compound,  $\text{C}_{12}\text{H}_{11}\text{BrO}_4\text{S}$ , was synthesized by the oxidation of methyl 2-(5-bromo-3-methylsulfanyl-1-benzofuran-2-yl)acetate with 3-chloroperoxybenzoic acid. The O atom and the methyl group of the methylsulfinyl substituent lie on opposite sides of the plane of the benzofuran ring system. The crystal structure is stabilized by  $\text{C}-\text{H}\cdots\pi$  interactions, involving a methyl H atom and the benzene ring of a neighbouring molecule, and by weak intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds.

### Related literature

## Methyl 2-(5-bromo-3-methylsulfinyl-1-benzofuran-2-yl)acetate

H. D. Choi, P. J. Seo, B. W. Son and U. Lee

### Comment

As a part of our ongoing research on the synthesis and structure of methyl 2-(3-methylsulfinyl-1-benzofuran-2-yl)acetate analogues, the crystal structure of methyl 2-(5-methyl-3-methylsulfinyl-1-benzofuran-2-yl)acetate (Choi *et al.*, 2008a) and methyl 2-(5-chloro-3-methylsulfinyl-1-benzofuran-2-yl) acetate (Choi *et al.*, 2008b) have been reported. Here we describe the crystal structure of the title compound (I), synthesized by the oxidation of methyl 2-(5-bromo-3-methylsulfanyl-1-benzofuran-2-yl)acetate with 3-chloroperoxybenzoic acid.

The molecular structure of compound (I) is illustrated in Fig. 1. The benzofuran unit is essentially planar, with a mean deviation of 0.013 (2) Å from the least-squares plane defined by the nine constituent atoms.

The crystal packing of compound (I) (see Fig. 2) is stabilized by intermolecular C—H···π interactions between an H-atom of the C12-methyl group and the benzene ring of the benzofuran fragment, with a C12—H12B···Cg<sup>IV</sup> separation of 3.903 (4) Å (Fig. 2 and Table 1; Cg is the centroid of benzene ring C2–C7, symmetry codes as in Fig. 2). In addition, the molecular packing exhibits three intermolecular C—H···O hydrogen bonds (Fig. 2 & Table 1).

### Experimental

77% 3-Chloroperoxybenzoic acid (190 mg, 0.85 mmol) was added in small portions to a stirred solution of methyl 2-(5-bromo-3-methylsulfanyl-1-benzofuran-2-yl)acetate (252 mg, 0.8 mmol) in dichloromethane (30 ml) at 273 K. After stirring for 3 h at rt, the mixture was washed with a saturated sodium bicarbonate solution and the organic layer was separated, dried over magnesium sulfate, filtered and concentrated under vacuum. The residue was purified by column chromatography (hexane-ethyl acetate 1:2, *v/v*) to afford compound (I) as a colorless solid [yield 86%, m.p. 405–406 K; *R*<sub>f</sub> = 0.45 (hexane-ethyl acetate, 1:2, *v/v*)]. Single crystals, suitable for X-ray analysis, were prepared by evaporation of a solution of compound (I) in benzene at rt. Spectroscopic analysis: <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ 3.06 (s, 3H), 3.75 (s, 3H), 4.04 (s, 2H), 7.34–7.53 (m, 2H), 7.44 (d, *J* = 8.80 Hz, 1H), 8.07 (d, *J* = 1.84 Hz, 1H); EI—MS 332 [M+2], 330[M<sup>+</sup>].

### Refinement

All the H-atoms were geometrically positioned and refined using a riding model: C—H = 0.93 (aromatic), 0.97 (methylene), and 0.96 Å (methyl) H atoms, with *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(C) (aromatic & methylene), and 1.5*U*<sub>eq</sub>(C) (methyl) H atoms.

	$0.40 \times 0.30 \times 0.20 \text{ mm}$

### Data collection

Bruker SMART CCD diffractometer	2560 independent reflections
Radiation source: fine-focus sealed tube	2084 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.015$
Detector resolution: 10.0 pixels $\text{mm}^{-1}$	$\theta_{\text{max}} = 26.0^\circ$
$T = 298(2) \text{ K}$	$\theta_{\text{min}} = 2.5^\circ$
$\varphi$ and $\omega$ scans	$h = -9 \rightarrow 5$
Absorption correction: multi-scan (SADABS; Sheldrick, 1999)	$k = -11 \rightarrow 11$
$T_{\text{min}} = 0.327, T_{\text{max}} = 0.530$	$l = -12 \rightarrow 12$
3786 measured reflections	

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
---------------------	--

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.035$	H-atom parameters constrained
$wR(F^2) = 0.099$	$w = 1/[\sigma^2(F_o^2) + (0.0506P)^2 + 0.5362P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.98$	$(\Delta/\sigma)_{\max} = 0.001$
2560 reflections	$\Delta\rho_{\max} = 0.35 \text{ e \AA}^{-3}$
164 parameters	$\Delta\rho_{\min} = -0.80 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
