Comment

1,4-Dicarbonyl compounds constitute key intermediates in various natural product syntheses, and they are important synthetic precursors of cyclopentenones, cyclopenta-1,3-diones, butenolides, and derivatives of furan and pyrrole (Chiu & Sammes, 1990; Greatrex *et al.*, 2003; Nagarajan & Shechter, 1984). Herewith we present the title compound (I) (Fig. 1). The asymmetric unit of (I) contains a half of the molecule located on a twofold rotational axis. Two benzene rings form a dihedral angle of 72.28 (2)°.

Experimental

The title compound was synthesized as previously described by Nevar *et al.* (2000). Colourless crystals suitable for X-ray data collection were obtained by slow evaporation of a 1:3 ratio EtOAc:cyclohexane solution at room temperature.

Refinement

All H atoms were positioned geometrically (C—H = 0.93–0.97 Å) and refined as riding, allowing for free rotation of the methyl groups. The constraint $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ or $1.5 U_{\text{eq}}(\text{C})$ (methyl C) was applied. In the absence of anomalous scatterers, no attempt was made to establish the absolute configuration of the title compound, and 488 Friedel pairs were merged before the final refinement.

Figures

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
