Received 15 November 2008; accepted 19 November 2008

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.003 \text{ \AA}$; disorder in main residue; R factor = 0.042; wR factor = 0.117; data-to-parameter ratio = 14.9.

The title Schiff base, $\text{C}_{11}\text{H}_{14}\text{ClNO}_4$, originally refined as a neutral molecule [Chumakov, Antosyak, Mazus, Tsapkov & Samus (2000), *Crystallogr. Rep.* **45**, 945–950], is interpreted as a zwitterionic compound. There are two independent zwitterions in the asymmetric unit. Five of the six hydroxy groups of the $-\text{CH}_2\text{OH}$ fragments are disordered. In one zwitterion, two are disordered over three sites [0.53 (1):0.33 (1):0.14 (1) and 0.65 (1):0.18 (1):0.17 (1)] and the third over two sites [0.66 (1):0.34 (1)]. In the second zwitterion, two are disordered over two sites [0.84 (1):0.16 (1) and 0.83 (1):0.17 (1)] and the third hydroxy group is ordered.

Related literature

The room-temperature crystal structure was interpreted as a neutral molecule; the disordered structure (the disorder confined to the hydroxy part of one of the six $-\text{CH}_2\text{OH}$ groups) refined to 0.072, see: Chumakov *et al.* (2000). The unsubstituted parent Schiff base is also a zwitterion; its structure has been determined several times, see: Asgedom *et al.* (1996); Odabaşoğlu *et al.* (2003); Tatar *et al.* (2005); Zhang *et al.* (2000).

Low-temperature redetermination of 4-chloro-2-[tris(hydroxymethyl)methyliminomethyl]phenol as zwitterionic 4-chloro-2-[tris(hydroxymethyl)methyliminomethyl]phenolate

S. W. Ng

Comment

A reevaluation of the title compound, originally reported as a neutral molecule (Chumakov *et al.*, 2000), shows a zwitterionic compound, at low temperature, Fig. 1.

Experimental

The compound was synthesized from the reaction of 5-chlorosalicylaldehyde and tris(hydroxymethyl)aminomethane (Chumakov *et al.*, 2000), and was recrystallized from ethanol.

Refinement

Five of the six hydroxy groups of the $-\text{CH}_2\text{OH}$ fragments are disordered. In one zwitterion, two are disordered over three sites [0.53 (1): 0.33: 0.14] and the third over two sites [0.65 (1): 0.18: 0.17]. In the second zwitterion, two are disordered over two sites [0.84 (1): 0.16 and 0.83 (1): 0.17] and the third is ordered. For each disordered $-\text{CH}_2\text{OH}$ fragment, the C–O distances (of the unprimed and primed atoms) were restrained to within 0.01 Å. The temperature factors of the primed atom(s) were restrained to those of the unprimed ones.

Carbon- and oxygen-bound hydrogen atoms were placed at calculated positions (C–H 0.95–0.99, O–H 0.84 Å) and were treated as riding on their parent atoms, with $U(\text{H})$ set to 1.2–1.5 times $U_{\text{eq}}(\text{C}, \text{O})$. The iminium hydrogen atoms were located in a difference Fourier map, and were refined with a distance restraint of N–H 0.88±0.01 Å; their temperature factors were freely refined.

Owing to the disorder, hydrogen bonding interactions involving the hydroxyl groups were not computed.

Figures

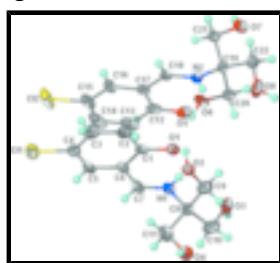

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of $\text{C}_{22}\text{H}_{28}\text{Cl}_2\text{N}_2\text{O}_8$ at the 70% probability level. Hydrogen atoms are drawn as spheres of arbitrary radius. The minor disorder components are not shown for clarity.
