Received 17 November 2008; accepted 24 November 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.006$ Å; R factor = 0.071; wR factor = 0.156; data-to-parameter ratio = 14.8.

The asymmetric unit of the title compound, $C_{22}H_{16}N_2O_4 \cdot 2CH_3OH$, contains one half-molecule and a methanol solvent molecule. The aromatic ring is oriented at a dihedral angle of $82.91(3)^\circ$ with respect to the planar indole ring systems. In the crystal structure, intermolecular O—H···O and N—H···O hydrogen bonds link the molecules into chains along the b axis.

3,7-Dihydroxy-3,7-diphenyl-2*H*,6*H*-pyrrolo[3,4-*f*]isoindole-1,5(3*H*,7*H*)-dione methanol disolvate

S. Liu, J.-N. Liu, P. Jiang, Q.-Y. Chu and H.-J. Zhu

Comment

The title compound is an important intermediate used to synthesize the monomer 2,5-dibenzoyl-1,4-phenylenediamine, which can be utilized to synthesize organic semiconductors and conjugated polymers (Tonzola *et al.*, 2003), which are of wide current interest for applications in electronic and optoelectronic devices including light-emitting diodes (Kolosov *et al.*, 2002), thin film transistors and photovoltaic cells (Antoniadis *et al.*, 1994). We report herein the crystal structure of the title compound, which is of interest to us in the field.

The asymmetric unit of the title compound (Fig. 1) contains one-half molecule and a methanol molecule, where the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Rings A (C1-C6), B (N/C7-C8/C11A) and C (C9-C11/C9A-C11A) are, of course, planar, and the dihedral angle between rings B and C is B/C = 1.66 (3)° [symmetry code: (A) 1/2 - x, 3/2 - y, 1 - z]. So, the indole ring is essentially planar. Ring A is oriented with respect to the planar indole ring at a dihedral angle of 82.91 (3)°. The intramolecular C-H···O hydrogen bond (Table 1) results in the formation of a nonplanar five-membered ring D (O1/C1/C6/C7/H1B) adopting envelope conformation with O1 atom displaced by 0.288 (3) Å from the plane of the other ring atoms.

In the crystal structure, intermolecular O-H···O and N-H···O hydrogen bonds (Table 1) link the molecules into chains along b axis (Fig. 2), in which they may be effective in the stabilization of the structure.

Experimental

The title compound was prepared according to the literature method (Liu *et al.*, 2008). Crystals suitable for X-ray analysis were obtained by dissolving the title compound (0.5 g) in methanol (50 ml), and evaporating the solvent slowly at room temperature for about 30 d.

Refinement

H atom (for NH) was located in difference synthesis and refined isotropically [N-H = 0.84 (4) Å and $U_{\text{iso}}(\text{H}) = 0.042$ (11) Å²]. Remaining H atoms were positioned geometrically, with O-H = 0.82 Å (for OH) and C-H = 0.93 and 0.96 Å for aromatic and methyl H, respectively, and constrained to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C,O})$, where x = 1.2 for aromatic H and x = 1.5 for all other H atoms.

supplementary materials

Figures

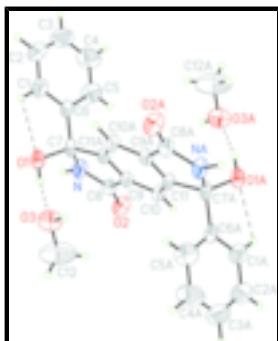

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 40% probability level [symmetry code: (A) $1/2 - x, 3/2 - y, 1 - z$]. Hydrogen bonds are shown as dashed lines.

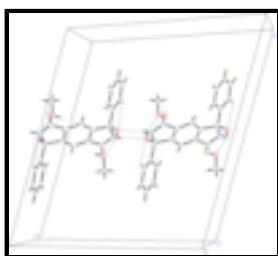

Fig. 2. A partial packing diagram of the title compound. Hydrogen bonds are shown as dashed lines.

Data collection

Enraf–Nonius CAD-4 diffractometer	$R_{\text{int}} = 0.075$
Radiation source: fine-focus sealed tube	$\theta_{\text{max}} = 26.0^\circ$
Monochromator: graphite	$\theta_{\text{min}} = 2.1^\circ$
$T = 298(2) \text{ K}$	$h = -21 \rightarrow 21$
$\omega/2\theta$ scans	$k = 0 \rightarrow 8$
Absorption correction: ψ scan (North <i>et al.</i> , 1968)	$l = -24 \rightarrow 24$
$T_{\text{min}} = 0.973, T_{\text{max}} = 0.991$	3 standard reflections

4477 measured reflections
 2245 independent reflections
 1050 reflections with $I > 2\sigma(I)$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.071$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.156$	$w = 1/[\sigma^2(F_o^2) + (0.0378P)^2 + 1.8P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{\max} < 0.001$
2245 reflections	$\Delta\rho_{\max} = 0.21 \text{ e \AA}^{-3}$
152 parameters	$\Delta\rho_{\min} = -0.25 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
