Received 24 November 2008; accepted 27 November 2008

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.071; wR factor = 0.152; data-to-parameter ratio = 13.9.

The asymmetric unit of the title compound, $\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}_2$, contains one half-molecule as the central C atom of the molecule lies on a twofold rotation axis. In the crystal structure, weak intermolecular $\text{C}-\text{H}\cdots\text{N}$ hydrogen bonds link the molecules into zigzag chains along c .

Comment

The biological activity of aminothiazoles has been well documented. They have broad applications in the treatment of allergies, hypertension, schizophrenia, inflammation, bacterial infections, and HIV (Kabalka & Mereddy, 2006). Dicarbonyl compounds represent an important class of starting materials used to increase the carbon number of organic compounds (Kim *et al.*, 2001). Many dicarbonyl compounds have been synthesized by the Michael addition method using diethyl malonate as starting compound, but only a few Michael addition diadducts were synthesized under normal conditions (Ranu & Banerjee, 2005; Ranu *et al.*, 2006). We are focusing our synthetic and structural studies on new products of Michael addition reactions from dicarbonyl compounds (Wang *et al.*, 2008) and we report here the crystal structure of the title compound (I), Fig. 1.

All bond lengths are within normal ranges (Allen *et al.*, 1987). The asymmetric unit contains one half-molecule, and the central C4 atom lies on a twofold rotation axis at right angles to the *ac* plane, which generates the other half-molecule. In the crystal structure weak, intermolecular C6—H6B···N hydrogen bonds link the molecules into zig-zag chains along the *c* axis, Table 1, Fig 2.

Experimental

2,4-Pentanedione (50 mmol) was dissolved in n-hexane (40 ml) and anhydrous potassium carbonate (100 mmol) and tetrabutylammonium bromide (0.5 g) added. Acrylonitrile (100 mmol) was added dropwise to this solution and the mixture refluxed for 6 h. 50 ml ethyl acetate were then added, the organic layer was filtered and the solvent removed under vacuum to yield the crude product (I). This was crystallized from ethyl acetate (15 ml). Crystals of (I) suitable for X-ray diffraction were obtained by slow evaporation of acetonitrile.

Refinement

All H atoms were positioned geometrically, with C—H = 0.96 and 0.97 Å for methyl and methylene H atoms, and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$, where $x = 1.5$ for methyl H and $x = 1.2$ for methylene H atoms.

Figures

Fig. 1. A view of the molecular structure of (I) showing the atom-numbering scheme and 30% displacement ellipsoids (arbitrary spheres for the H atoms).

Fig. 2. The crystal packing of (I), viewed down the a axis. Hydrogen bonds are drawn as dashed lines.

$$\Delta\rho_{\min} = -0.19 \text{ e } \text{\AA}^{-3}$$

Primary atom site location: structure-invariant direct methods

Extinction correction: none

Special details

Experimental. ^1H NMR (DMSO, δ , p.p.m.) 2.15 (s, 6H), 2.23 (t, 4H), 2.31(t, 4H).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
