Received 6 November 2008; accepted 1 December 2008

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.001\text{ \AA}$; R factor = 0.033; wR factor = 0.098; data-to-parameter ratio = 31.9.

In the title compound, $\text{C}_{17}\text{H}_{14}\text{ClN}_5\text{OS}$, the dihedral angles formed by the two benzene rings with the triazole ring are 66.88 (3) and 19.16 (3) $^\circ$, and the benzene rings are inclined to each other with a dihedral angle of 78.40 (3) $^\circ$. Intermolecular N–H···O hydrogen bonds link the molecules into layers parallel to the (100) planes, and centrosymmetric π – π stacking interactions [centroid–centroid distance = 3.7717 (5) \AA] are formed between benzene rings in neighbouring layers.

3-Benzamidomethyl-4-[(E)-2-chlorobenzylideneamino]-1*H*-1,2,4-triazole-5(4*H*)-thione

H.-K. Fun, S. R. Jebas, J. N. Rao and B. Kalluraya

Comment

1,2,4-Triazoles and their derivatives represent a rapidly developing field in modern heterocyclic chemistry, in part due to their antibacterial, antifungal, antitubercular, anticancer (Kalluraya *et al.*, 1996), antitumor (Al-Soud *et al.*, 2003), anticonvulsant (Almasirad *et al.*, 2004), anti-inflammatory, and analgesic properties (Amir & Shikha, 2004). Certain 1,2,4-triazoles also find applications in the preparation of photographic plates, polymers, and as analytical agents (Kawashima *et al.*, 1986). In continuation of our interest in the synthesis of chemically and biologically important heterocycles, we report here a substituted 1,2,4-triazole Schiff base.

In the title compound (Fig. 1), the dihedral angles formed by the triazole (N2/N3/C10/N4/C9) ring with the two benzene rings (C1–C6; C12–C17) are 66.88 (3) $^{\circ}$ and 19.16 (3) $^{\circ}$ respectively. The benzene rings (C1–C6; C12–C17) form a dihedral angle of 78.40 (3) $^{\circ}$, indicating that they are inclined to each other. The structure contains intermolecular N—H···O hydrogen bonds (see Table), linking the molecules into two-dimensional networks parallel to the (100) planes (Fig. 2). Between layers, π — π stacking interactions are formed between inversion-related benzene rings (C12–C17 and its symmetry equivalent 2-*x*, 2-*y*, 1-*z*) with centroid-centroid distance 3.7717 (5) Å.

Experimental

The title compound was obtained by refluxing *N*-[(4-amino-5-sulfanyl-4*H*-1,2,4-triazol-3-yl)methyl]benzamide (0.01 mol) and 2-chlorobenzaldehyde (0.01 mol) in ethanol (30 ml) with 3 drops of concentrated sulfuric acid for 5 h. The solid product obtained was collected by filtration, washed with ethanol and dried. The product was then recrystallized using ethanol.

Refinement

The amino H atoms were located in a difference map and refined with restraints of N—H = 0.85 (1) Å. The remaining H atoms were positioned geometrically [C—H = 0.93 Å (aromatic) or 0.97 Å (methylene)] and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

Figures

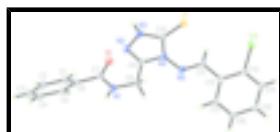

Fig. 1. The molecular structure of the title compound, showing 50% probability displacement ellipsoids for non-H atoms.

supplementary materials

 2 restraints Extinction correction: none
 Primary atom site location: structure-invariant direct
 methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
