Received 23 November 2008; accepted 5 December 2008

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$;
 R factor = 0.063; wR factor = 0.168; data-to-parameter ratio = 13.4.

The title compound, $C_{11}H_{12}O_2$, is an intermediate in the synthesis of Varenicline, a nicotinic receptor partial agonist used to treat smoking addiction. In the crystal structure, there is an intramolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bond that generates an $S(5)$ ring motif. Intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds form centrosymmetric dimers and also link these dimers into chains along the a axis.

Related literature

For background to the use of Varenicline to treat smoking addiction, see: Vetelino, (2004); Coe (2005). For details of graph-set analysis of hydrogen-bonding patterns, see: Bernstein *et al.* (1995).

J. Xu, H. Xu, J. Quan, F. Sha and C. Yao

Comment

The title compound, I, is an important intermediate in the synthesis of Varenicline, a nicotinic receptor partial agonist used to treat smoking addiction (Vetelino, 2004). Varenicline came onto the market in 2006 and displays high affinity for neuronal nicotinic acetylcholine receptors (nAChRs), which mediate the dependence-producing effects of nicotine (Coe, 2005).

We report here the crystal structure of the title compound, (I), Fig. 1. The saturated six-membered C4,C5,C7···C10 ring of the anthracene group carries hydroxy substituents on C8 and C9 and is bridged by the C11 methylene group. In the crystal structure an intramolecular O1—H1A···O2 hydrogen bond generates an S5 ring motif (Bernstein *et al.*, 1995). Intermolecular O1—H1A···O2 hydrogen bonds form centrosymmetric dimers and link these dimers into chains along the *a* axis, Table 2, Figure 2.

Experimental

1,4-Dihydro-1,4-methanonaphthalene (79.5 g, 560 mmol) in acetone (800 ml) and H₂O (100 ml) was stirred with *N*-methyl morpholine N-oxide (67.5 g, 576 mmol). OsO₄ (15 ml of a 15 mol% t-BuOH solution, 1.48 mmol, 0.26 mol%) was added and the mixture was stirred vigorously. After 60 h, the solution was filtered, and the white solid product rinsed with acetone and air-dried (60.9 g). The mother liquor was partially concentrated to an oily solid which was triturated with acetone, filtered and rinsed with acetone to provide additional amounts of the title compound (27.4 g, total 88.3 g, 89%). An X-ray grade crystal of I was grown from acetone (10 ml) at room temperature.

Refinement

H atoms bound to O were located in a difference Fourier map and fixed in these positions with U_{iso} = 1.5U_{eq} (O). Other H-atoms were positioned geometrically and refined using a riding model with d(C-H) = 0.93 Å, U_{iso} = 1.2U_{eq} (C) for aromatic 0.98 Å, U_{iso} = 1.2U_{eq} (C) for CH, 0.97 Å, U_{iso} = 1.2U_{eq} (C) for CH₂ groups.

Figures

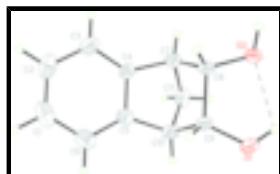

Fig. 1. The molecular structure of (I), showing the atom-numbering scheme and displacement ellipsoids at the 30% probability level.

supplementary materials

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
