Received 21 November 2008; accepted 11 December 2008

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ; disorder in solvent or counterion;  $R$  factor = 0.066;  $wR$  factor = 0.198; data-to-parameter ratio = 11.5.

In the structure of the title compound,  $\text{C}_{10}\text{H}_{10}\text{N}_2^{2+}\cdot 2\text{ClO}_4^- \cdots 4\text{C}_7\text{H}_7\text{NO}_2\cdot 2\text{C}_{10}\text{H}_8\text{N}_2\cdot 2\text{H}_2\text{O}$ , the 4,4'-bipyridinium cation has a crystallographically imposed centre of symmetry. The cation is linked by  $\text{N}-\text{H} \cdots \text{N}$  hydrogen bonds to adjacent 4,4'-bipyridine molecules, which in turn interact via  $\text{O}-\text{H} \cdots \text{N}$  hydrogen bonds with 4-aminobenzoic acid molecules, forming chains running parallel to [302]. The chains are further connected into a three-dimensional network by  $\text{N}-\text{H} \cdots \text{O}$  and  $\text{O}-\text{H} \cdots \text{O}$  hydrogen-bonding interactions involving the perchlorate anion, the water molecules and the 4-aminobenzoic acid molecules. In addition,  $\pi-\pi$  stacking interactions with centroid–centroid distances ranging from 3.663 (6) to 3.695 (6)  $\text{\AA}$  are present. The O atoms of the perchlorate anion are disordered over two sets of positions, with refined site occupancies of 0.724 (9) and 0.276 (9).

## 4,4'-Bipyridinium bis(perchlorate)-4-aminobenzoic acid-4,4'-bipyridine-water (1/4/2/2)

**Q.-H. Meng, L. Han, J.-D. Hou, Y.-F. Luo and R.-H. Zeng**

### Comment

Hydrogen-bonding interactions between ligands are specific and directional. In this sense, 4-aminobenzoic acid and 4,4'-bipyridine are the excellent candidates for the construction of three-dimensional network motifs, as they form regular hydrogen bonds functioning as both hydrogen-bond donors and acceptors (Clemente & Marzotto, 2004; Hu *et al.*, 2003; Yang *et al.*, 2004). Recently, we obtained the title compound under hydrothermal conditions and report its crystal structure herein.

In the title compound (Fig. 1), all bond lengths and angles are unexceptional. The 4,4'-bipyridinium cation, which is located on a centre of symmetry, acts as a N—H hydrogen bond donor on both sides to unprotonated 4,4'-bipyridine molecules, which in turn act as O—H hydrogen bond acceptors from one of the two independent 4-aminobenzoic acid molecules. Two 4-aminobenzoic acid molecules, two 4,4'-bipyridine molecules and the cation are thus connected by hydrogen bonding interactions to form a linear centrosymmetric chain running parallel to the [3 0  $\bar{2}$ ] direction. These chains are further connected by O—H $\cdots$ O and N—H $\cdots$ O hydrogen bonds (Table 1) *via* the interstitial solvate water molecules, the perchlorate anions and the other 4-aminobenzoic acid molecules, forming a three-dimensional network (Fig. 2). The crystal packing is stabilized by  $\pi\cdots\pi$  stacking interactions involving both pyridine rings of the unprotonated 4,4'-bipyridine molecule, the N5/C25-C29 pyridine ring of the cation and the C12-C17 benzene ring of one 4-aminobenzoic acid molecule:  $Cg1\cdots Cg2^i = 3.695(6)$  Å;  $Cg1\cdots Cg3 = 3.663(6)$  Å;  $Cg3\cdots Cg4^{ii} = 3.674(7)$  Å [ $Cg1$ ,  $Cg2$ ,  $Cg3$  and  $Cg4$  are the centroids of the N1/C1–C5, N2/C6–C10, C12–CC17 and N5/C25–C29 rings, respectively. Symmetry codes: (i) = 1-x, 1-y, -z; (ii) = 1-x, y, z].

### Experimental

4-Aminobenzoic acid (1 mmol, 0.137 g), 4,4'-bipyridine (1 mmol, 0.156 g) and sodium perchlorate (1 mmol, 0.123 g) were dissolved in hot water with stirring. Colourless single crystals were obtained at room temperature by slow evaporation of the solvent over a period of several days.

### Refinement

The disordered perchlorate ion was refined into two sites with refined occupancies of 0.724 (9) and 0.276 (9). The Cl $\cdots$ O and O $\cdots$ O distances were restrained to be 1.44 (1) and 2.35 (1) Å, respectively. Water H atoms were located in a difference Fourier map and refined with distance restraints of O—H = 0.86 Å and H $\cdots$ H = 1.39 Å. The H atom bound to the N5 nitrogen atom in the cation and the carboxylic H atoms were refined with N—H and O—H distance restraints of 0.90 Å. All other H atoms were placed at calculated positions and treated as riding on the parent atoms, with C—H = 0.93 Å, N—H = 0.86 Å, and with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C}, \text{N})$ .

$b = 10.1105(4) \text{ \AA}$	Cell parameters from 2787 reflections
$c = 16.5830(6) \text{ \AA}$	$\theta = 2.4\text{--}21.0^\circ$
$\alpha = 91.487(2)^\circ$	$\mu = 0.19 \text{ mm}^{-1}$
$\beta = 98.529(3)^\circ$	$T = 296(2) \text{ K}$
$\gamma = 118.500(2)^\circ$	Block, colourless
$V = 1462.68(10) \text{ \AA}^3$	$0.20 \times 0.18 \times 0.15 \text{ mm}$

### Data collection

Bruker APEXII area-detector diffractometer	3142 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}} = 0.058$
Monochromator: graphite	$\theta_{\max} = 25.2^\circ$
$T = 296(2) \text{ K}$	$\theta_{\min} = 2.3^\circ$
$\varphi$ and $\omega$ scans	$h = -12 \rightarrow 11$
Absorption correction: None	$k = -11 \rightarrow 12$
18132 measured reflections	$l = -18 \rightarrow 19$
5242 independent reflections	

## *Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.066$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.198$	$w = 1/[\sigma^2(F_o^2) + (0.0835P)^2 + 0.5543P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{\max} < 0.001$
5242 reflections	$\Delta\rho_{\max} = 0.37 \text{ e \AA}^{-3}$
455 parameters	$\Delta\rho_{\min} = -0.41 \text{ e \AA}^{-3}$
74 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

## *Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
