# 2,2'-(*p*-Phenylenedimethylene)bis (propane-1,3-diol)

## Yajun Gao, Haitao Xi, Xiaoqiang Sun,\* Yongsheng Fu and Li Liu

School of Chemistry and Chemical Engineering, Jiangsu Polytechnic University, Changzhou 213164, People's Republic of China Correspondence e-mail: xiaoqiang\_sun@yahoo.com.cn

Received 11 October 2008; accepted 9 December 2008

Key indicators: single-crystal X-ray study; T = 291 K; mean  $\sigma$ (C–C) = 0.002 Å; R factor = 0.038; wR factor = 0.115; data-to-parameter ratio = 18.6.

The molecule of the title compound,  $C_{14}H_{22}O_4$ , is centrosymmetric. In the crystal, the molecules are linked through  $O-H \cdots O$  hydrogen bonds into a three-dimensional network.

#### Comment

Reduction is a fundamental transformation in organic synthesis. Lithium aluminium hydride is used in organic synthesis as a powerful reducing agent.

The title molecule has a crystallographic inversion center located at the middle of the benzene ring. The *trans*-arrangement of two 1,3-dihydroxyisopropyl groups in the title compound was verified by X-ray crystallographic studies (Fig.1). The torsion angle C3—C4—C5—C6 is 165.14 (10) ° and the torsion angle of C3-C4-C5- C7 is -70.96 (13).

#### Experimental

Tetraethyl 2,2'-(*p*-phenylenedimethylene)dimalonate was prepared according to the literature procedure (Xi *et al.*, 2008). In a flame-dryed, round-bottom flask was placed freshly distilled THF (80 ml) under dry nitrogen gas and the flask was placed in an ice-bath. Subsequently LiAlH<sub>4</sub> (2.128 g, 56 mmol) was slowly added with stirring, followed by a dropwise addition of the solution of tetraethyl 2,2'-(*p*-phenylenedimethylene)dimalonate (2.95 g,7 mmol) in THF (20 ml). After stirring for 3 h at room temperature, a saturated solution of Na<sub>2</sub>SO<sub>4</sub>(3 ml) was added. Stirring was continued for next 10 min. Then ethanol (8 mL) was added, the mixture was heated to 333 K. Lithium and aluminium salts were separated by filtration on celite. Filtrate was evaporated and the residue purified by crystallization, yielding the title compound (1.09 g, yield 61%; m.p. 448–449 K). Crystals suitable for X-ray analysis were obtained by slow evaporation of an aqueous solution at 288 K.

#### Refinement

Carbon bound H atoms were placed geometrically and treated as riding on their carriers, with methylene C—H distance of 0.97 Å, aromatic C—H of 0.93 Å and  $U_{iso}(H) = 1.2Ueq(C)$ . H atoms from hydroxyl groups were refined with the distance restraint of O—H = 0.82 (2) Å and  $U_{iso}(H) = 1.5 U_{eq}(O)$ .

#### **Figures**

Fig. 1. View of the title molecule showing the atom-labelling scheme; displacement ellipsoids are shown at the 30% probability level (symmetry code to generate atoms with the label A: 2-x, 1-y, 1-z)

Fig. 2. Crystal packing of the title compound viewed down the b direction. Dashed lines indicate hydrogen bonds.

## Special details

**Geometry**. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement**. Refinement of  $F^2$  against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on  $F^2$ , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on  $F^2$  are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
