Correspondence e-mail: kluef@cup.uni-muenchen.de

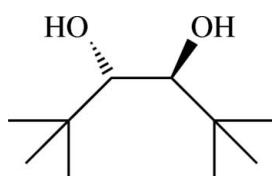

Received 28 November 2008; accepted 22 December 2008

Key indicators: single-crystal X-ray study; $T = 200$ K; mean $\sigma(\text{C–C}) = 0.003 \text{ \AA}$; R factor = 0.041; wR factor = 0.109; data-to-parameter ratio = 12.7.

In the crystal structure of the title compound, $\text{C}_{10}\text{H}_{22}\text{O}_2$, cooperative chains of $\text{O}–\text{H} \cdots \text{O}$ hydrogen bonds are established by intra- as well as intermolecular interactions. These hydrogen bonds connect the molecules into infinite strands along [100], with a binary level graph-set descriptor $C_2^2(4)$. Excluding the H atoms on the hydroxy groups, the molecule shows non-crystallographic C_2 symmetry.

Related literature

The compound was synthesized according to a published procedure (Boehrer *et al.*, 1997). For the crystal structures of other ethane-1,2-diol derivatives with bulky substituents, see: Betz & Klüfers (2007); Allscher *et al.* (2008). For graph-set descriptors, see: Etter *et al.* (1990); Bernstein *et al.* (1995).

Comment

The title compound was synthesized as a potential chelating ligand with sterically demanding substituents on the carbon backbone to estimate the influence of steric pretense on coordination reactions with different central atoms.

In the molecule (Fig. 1) bond lengths and angles are found in the range apparent for other vicinal diols bearing sterically more demanding substituents (Betz & Klüfers, 2007, Allscher *et al.*, 2008). While the *tert*-butyl groups adopt a staggered conformation with respect to the hydroxy groups, the O atoms are present in a nearly eclipsed arrangement. The reason for this unfavourable conformation becomes evident when examining intermolecular contacts.

In the crystal structure, inter- and intramolecular hydrogen bonds are present which connect the molecules into strands along [1 0 0] (Fig. 2). The bulky hydrophobic *tert*-butyl groups encase this strand of hydroxyl groups. The hydrogen bonds form cooperative chains. In terms of graph-set analysis (Etter *et al.*, 1990; Bernstein *et al.*, 1995) the descriptor for these chains on the binary level is C²₂(4).

Excluding the H atoms on the hydroxy groups, the molecule shows non-crystallographic *C*₂ symmetry.

The molecular packing of the title compound is shown in Figure 3.

Experimental

The title compound was prepared according to a published procedure (Boehrer *et al.*, 1997). Crystals suitable for X-ray studies were obtained upon recrystallization from boiling toluene.

Refinement

Due to the absence of a strong anomalous scatterer, the absolute structure parameter, which is 0.982 with an estimated standard deviation of 1.241 for the unmerged data set, is meaningless. Thus 1056 Friedel opposites have been merged and the absolute configuration has been arbitrarily chosen.

Carbon-bound as well as oxygen-bound H atoms were placed in calculated positions (C—H 1.00 Å for CH-groups, C—H 0.98 Å for methyl groups and O—H 0.84 Å for hydroxy groups) and were included in the refinement in the riding model approximation, with *U*(H) set to 1.2*U*_{eq}(C) for the CH-groups and 1.5*U*_{eq}(C) for methyl groups and 1.5*U*_{eq}(O) for the hydroxy groups.

supplementary materials

Figures

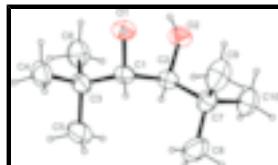

Fig. 1. The molecular structure of the title compound, with atom labels and anisotropic displacement ellipsoids (drawn at 50% probability level) for non-H atoms.

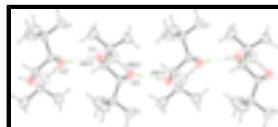

Fig. 2. Hydrogen bonds in the crystal structure of the title compound, viewed along [0 0 1]. Underlying hydrogen bonds are not illustrated for clarity. Symmetry codes: $i_x + 1/2, -y + 1/2, -z + 2$; $ii_x - 1/2, -y + 1/2, -z + 2$.

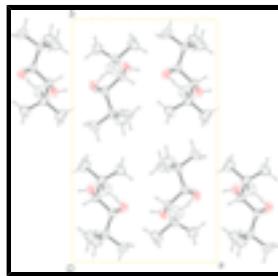

Fig. 3. The packing of the title compound, viewed along [0 0 -1].
