Received 5 December 2008; accepted 6 January 2009

Key indicators: single-crystal X-ray study; $T = 90$ K; mean $\sigma(C-C) = 0.004$ Å; R factor = 0.037; wR factor = 0.076; data-to-parameter ratio = 30.1.

The title molecule, $[RuCl_2(C_4H_8OS)_3(H_2O)]$, is the isomer with the two chloride ligands *cis* and the three *S*-coordinated tetramethylene sulfoxide ligands facial relative to the Ru(II) center. The Ru—Cl distances are 2.4161 (7) and 2.4317 (7) Å, the Ru—O distance is 2.1540 (19) Å, and the Ru—S distances are in the range 2.2254 (8)–2.2657 (7) Å, with the shortest being that *trans* to the aqua ligand. The coordinated water molecule forms intermolecular hydrogen bonds with Cl and sulfoxide O atoms.

***fac*-Aquadichloridotris(tetramethylene sulfoxide- κ S)ruthenium(II)**

R. S. Srivastava, C. F. Gonzales and F. R. Fronczek

Comment

During the course of our studies on ruthenium-DMSO/TMSO complexes, *mer*-RuCl₃(TMSO)₃ was refluxed with methyl-*p*-tolylsulfide in absolute ethanol for 1 h. In view of anticancer properties of Ru-DMSO/TMSO complexes, we envision to interact *mer*-RuCl₃(TMSO)₃, (1) with sulfur donor ligands, because sulfur-containing ligands are able to bind the metal center strongly and prevent interactions with sulfur-containing enzymes (Aldinucci *et al.*, 2007). In fact, these reactions are believed to be responsible for the nephrotoxicity induced by the platinum (II)-based drugs. However, the compound (2) was hydrolyzed on long standing in solution, and finally the title compound, *fac*-[RuCl₂(TMSO)₃(H₂O)] (3) was isolated. A plausible mechanism of the formation of (3) is shown in scheme 2.

There are three geometrical isomers of the title compound: *trans,mer*; *cis,mer*; and *fac*. The reported structure is found to be the latter, with chloro groups *cis* and TMSO groups facial, as shown in Fig. 1. More isomers are possible, considering that the TMSO ligands may be coordinated to Ru through either S or O in the same complex, (Srivastava & Fronczek, 2003; Srivastava *et al.*, 2004); however, all are S-coordinated here. Relevant bond distances are given in the supplementary Tables. Most noteworthy is that the Ru—S₃ distance, *trans* to water, is 0.03–0.04 Å shorter than the two Ru—S distances *trans* to Cl. While a search of the Cambridge Structural Database (version 5.29, Jan. 2008; Allen, 2002) for Ru complexes with S-bonded TMSO *trans* to water produced no hits, eleven examples of such DMSO complexes were found, refcodes AQAX-IZ, AQAXOF, AQAXUL, BINBAC, CECSUZ, QUDRUC, TEXMOZ, TEXNEQ, TEXNIU, WOHNEM, AND WOHNHQ. Those have mean Ru—O distance 2.142 Å and mean Ru—S distance 2.256 Å. Our Ru—O distance, 2.1540 (19) Å, is near the high end of that sample, and our Ru—S distance, Ru1 S3 2.2254 (8) Å, is shorter than any in that sample.

The coordinated water molecule donates an intermolecular hydrogen bond to sulfoxide O and another to Cl, on two different molecules related by unit translation in the b direction. Thus, rings of graph set (Etter, 1990) symbol $R^2_2(9)$ form chains along [010], propagated by the 2₁ axis, as shown in Fig. 2.

Experimental

mer-RuCl₃(TMSO)₃ (0.166 g, 0.233 mmol) was refluxed with methyl-*p*-tolylsulfide (73 µl, 0.533 mmol) in absolute ethanol (15 ml) for 2 h, followed by cooling to room temperature. Upon standing for eight months, colorless needles of the title compound formed.

Refinement

H atoms on C were placed in idealized positions with C—H distances 0.99 Å and thereafter treated as riding. Water H atoms were located in difference maps, idealized to have O—H distance 0.80 Å, and treated as riding. U_{iso} for H was assigned as 1.2 times U_{eq} of the attached atoms (1.5 for H₂O). The largest negative feature in the final difference map was located 0.75 Å from the Ru position.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.076$	$w = 1/[\sigma^2(F_o^2) + (0.0256P)^2 + 2.7566P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.02$	$(\Delta/\sigma)_{\max} = 0.002$
5982 reflections	$\Delta\rho_{\max} = 0.87 \text{ e } \text{\AA}^{-3}$
199 parameters	$\Delta\rho_{\min} = -1.12 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
