Received 4 December 2008; accepted 14 January 2009

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(C-C) = 0.006$  Å;  
 $R$  factor = 0.055;  $wR$  factor = 0.130; data-to-parameter ratio = 14.5.

The asymmetric unit of the title compound,  $[Zn(C_{12}H_8N_5)_2 \cdot (C_2H_8N_2)] \cdot CH_3OH \cdot 2H_2O$ , contains a Zn<sup>II</sup> cation, octahedrally coordinated by two 3-(2-pyridyl)-5-(4-pyridyl)-1,2,4-triazolate anions, a chelating ethane-1,2-diamine molecule, a methanol solvent molecule, and two crystal water molecules. In the crystal packing, complex molecules are linked by hydrogen bonds into a two-dimensional layer.

**(Ethylenediamine- $\kappa^2N,N'$ )bis[3-(2-pyridyl)-5-(4-pyridyl)-1,2,4-triazolato- $\kappa^2N^2,N^3$ ]zinc(II) methanol solvate dihydrate**

**L. Cheng, Y.-Y. Sun, Y.-W. Zhang and J.-Q. Wang**

**Comment**

Recently, there has been significant interest in the rational design and synthesis of chiral coordination polymers due to their potential functions, such as enantioselective separations and catalysis, which could be obtained by using chiral and achiral ligands (Kesanli *et al.* 2003; Wang *et al.* 2005). The use of achiral ligands is more attractive since usually such ligands are easier to be generated. Asymmetric ligands, as achiral ligands, have been widely used to construct those non-centrosymmetrical polymers. Unfortunately, here, we synthesized a centrosymmetrical complex  $Zn(C_{12}H_8N_5)_2(C_2H_8N_2).CH_3OH.2H_2O$ , with an asymmetric 3-(2-pyridyl)-5-(4-pyridyl)-4H-1,2,4-triazole ligand.

The asymmetric unit of the title compound, contains one  $Zn^{II}$  cation, two 3-(2-pyridyl)-5-(4-pyridyl)-1,2,4-triazolato anions, one chelating ethane-1,2-diamine, methanol solvate and two crystal water molecules. The complex is mononuclear with  $Zn^{II}$  in a distorted octahedral geometry of two chelating triazolato anions, and one chelating ethane-1,2-diamine ligand. Each triazolato group acts as a bidentate chelating ligand whereas the N atom of 4-pyridyl group does not take part in coordination (Table 1 and Fig. 1). In the crystal, the complex molecules are linked by N—H···O, O—H···N and O—H···O hydrogen bonds into a two-dimensional layer (Table 2 and Fig. 2).

**Experimental**

A mixture of 3-(2-pyridyl)-5-(4-pyridyl)-4H-1,2,4-triazole (0.0446 g, 0.2 mmol),  $ZnSO_4 \cdot 7 H_2O$  (0.0288 g, 0.1 mmol), ethane-1,2-diamine (0.1 ml), methanol (2 ml) and water (2 ml) was stirred for 0.5 h at room temperature, and then filtered. The filtrate was allowed to evaporate slowly at room temperature. After 2 weeks, colourless needle crystals were obtained in 34% yield (0.0217 g) based on  $Zn^{II}$ .

**Refinement**

H atoms bonded to N and O atoms were located in a difference map with the distances of N—H = 0.90 and O—H = 0.85–0.90 Å. Other H atoms were positioned geometrically and refined using a riding model with C—H = 0.93–0.97 Å and with  $U_{iso}(H) = 1.2$ .

## *Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.055$	H-atom parameters constrained
$wR(F^2) = 0.130$	$w = 1/[\sigma^2(F_o^2) + (0.0579P)^2 + 0.853P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{\max} < 0.001$
5643 reflections	$\Delta\rho_{\max} = 0.61 \text{ e \AA}^{-3}$
388 parameters	$\Delta\rho_{\min} = -0.56 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
