Received 15 January 2009; accepted 22 January 2009

Key indicators: single-crystal X-ray study; $T = 273$ K; mean $\sigma(\text{C}-\text{C}) = 0.009$ Å; R factor = 0.038; wR factor = 0.104; data-to-parameter ratio = 13.9.

In the title compound, $[\text{Cu}(\text{C}_2\text{H}_2\text{IO}_2)_2(\text{C}_{12}\text{H}_8\text{N}_2)(\text{H}_2\text{O})]$, the Cu^{II} ion is coordinated by two N atoms [Cu—N = 2.013 (4) and 2.024 (4) Å] from a 1,10-phenanthroline ligand and three O atoms [Cu—O = 1.940 (4)–2.261 (4) Å] from two carboxyl ligands and a water molecule in a distorted square-pyramidal geometry. One iodoacetate O atom [Cu—O = 2.775 (4) Å] completes the coordination to form a distorted octahedron. Intermolecular O—H···O hydrogen bonds link the molecules into centrosymmetric dimers, which are further packed by π – π interactions between the 1,10-phenanthroline ligands into layers parallel to the *ab* plane. The crystal packing also exhibits short intermolecular I···I contacts of 3.6772 (9) Å and weak C—H···O hydrogen bonds.

Related literature

The related crystal structure of aquabis(2,4-dichlorophenoxyacetato-*O*)(1,10-phenanthroline- κ^2 N,N')copper(II) has been reported by Liu *et al.* (2006).

Aquabis(2-iodoacetato- κO)(1,10-phenanthroline- $\kappa^2 N,N'$)copper(II)

R. Zhao, J. Sun, J. Lu and J. Li

Comment

Metal complexes with carboxylates are among the most investigated complexes in the field of coordination chemistry. Due to their versatile bonding modes with metal ions, they have also been used in the synthesis of mononuclear monomeric and polymeric complexes (Liu *et al.*, 2006). In order to develop some new topological structures, we study the reaction of the copper(II) ion and 2-iodoacetic acid with the presence of 1,10-phenanthroline.

The molecular structure of the title complex is shown in Fig. 1. The Cu atom exhibits a six-coordinated distorted octahedral pyramidal geometry with two carboxyl O atoms from (Cu2—O4 2.000 (4) Å, Cu2—O5 2.775 (4) Å), a water molecule (Cu—O 2.261 (4) Å) and a nitrogen atom (Cu2—N2 2.024 (4) Å) occupying the equatorial planar position. A nitrogen atom N2 (Cu2—N2 2.013 (4) Å) and a carboxyl O atom (Cu2—O2 1.940 (4) Å) occupy the apical positions. The displacement of the metal atom from the basal plane is 0.0640 (2) Å. The crystal packing exhibits short intermolecular I···I contacts (Table 1) and weak C—H···O hydrogen bonds (Table 2).

Experimental

The reaction was carried out by the solvothermal method. 2-iodoacetic acid(0.372 g, 2 mmol) and cupric acetate(0.199 g, 1 mmol) and 1,10-phenanthroline(0.180 g, 1 mmol) were added to the airtight vessel with 20 ml water. The resulting green solution was filtered. The filtrate was placed for several days yielding blue block-shaped crystals.

The yield is 81%. Elemental analysis: calc. for $C_{16}H_{14}CuI_2N_2O_5$: C 30.42, H 2.23, N 4.43; found: C 30.15, H 2.49, N 4.22. The elemental analyses were performed with PERKIN ELMER MODEL 2400 SERIES II.

Refinement

All the H atoms were found in Fourier map, but placed in idealized positions(C—H 0.93–0.97 Å, O—H 0.85 Å), with the $U_{\text{iso}}(\text{H})$ values were set at $1.2U_{\text{eq}}(\text{C}, \text{O})$ of the parent atoms.

Figures

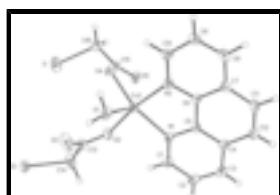

Fig. 1. The molecular structure of the title compound showing the atomic numbering and 30% probability displacement ellipsoids.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.038$	H-atom parameters constrained
$wR(F^2) = 0.104$	$w = 1/[\sigma^2(F_o^2) + (0.056P)^2 + 3.6149P]$ where $P = (F_o^2 + 2F_c^2)/3$
S = 1.01	$(\Delta/\sigma)_{\text{max}} < 0.001$
3305 reflections	$\Delta\rho_{\text{max}} = 1.53 \text{ e \AA}^{-3}$
237 parameters	$\Delta\rho_{\text{min}} = -1.68 \text{ e \AA}^{-3}$
3 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
