Received 15 December 2008; accepted 7 January 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.066; wR factor = 0.173; data-to-parameter ratio = 14.1.

In the title compound, $C_{22}H_{19}\text{NO}$, the dihedral angle between the benzene ring and the carbazole ring system $77.1(1)^\circ$. The crystal structure is stabilized by intermolecular aromatic $\pi-\pi$ interactions between the benzene ring and the pyrrole ring of the carbazole system of neighbouring molecules [centroid–centroid distance = $3.617(4)\text{ \AA}$]. In addition, the crystal structure exhibits a weak intermolecular $\text{C}-\text{H}\cdots\pi$ interaction.

9-Ethyl-3-(2-methylbenzoyl)-9H-carbazole

Y.-C. Hang, M.-D. Chen and Y. Wang

Comment

The title compound is one of important intermediates in synthesis of carbazole-containing compounds used as organic optoelectronic materials which have the characteristic of large $\pi-\pi$ conjugation bonds (Bai *et al.* 2007; Promarak *et al.* 2007; Liu *et al.* 2009). Here we report the crystal structure of the title compound, 9-ethyl-3-(2-methylbenzoyl)carbazole (Fig. 1).

In the title compound, the bond lengths and angles are within normal ranges (Allen *et al.*, 1987). Rings of A (C3–8), B (C3/C8/C9/C14/N), C (C9–14) and D (C16–21) are approximately plane, and dihedral angles of the four rings are: A/B = 1.1 (1) $^\circ$, B/C = 2.6 (1) $^\circ$, C/D = 76.0 (2) $^\circ$. The crystals structure is stabilized by intermolecular aromatic $\pi-\pi$ interactions between the benzene ring and the pyrrole ring of the carbazole system of neighbouring molecules. The Cg1 \cdots Cg2ⁱⁱⁱ distance is 3.617 (4) Å (Fig. 2; Cg1 and Cg2 are the centroids of the C3–C8 benzene ring and the C3/C8/C9/C14/N pyrrole ring, respectively, symmetry code as in Fig. 2). The molecular packing is further stabilized by intermolecular C—H \cdots π interactions ; one between the hydrogen on the benzene ring and the benzene ring of neighbouring molecules (C12—H12A \cdots Cg1ⁱ), a second the hydrogen on the benzene ring and the pyrrole ring of neighbouring molecules (C13—H13A \cdots Cg2ⁱ), a third between the hydrogen of C–22 methyl group and the benzene ring of neighbouring molecules (C22—H22B \cdots Cg3ⁱⁱ) (Fig. 2 and Table 1; Cg3 is the centroids of the C16–C21 benzene ring, symmetry code as in Fig. 2).

Experimental

The title compound, (I) was prepared by a similar method reported in literature (Feng *et al.*, 2007) with some modification. The crystals were obtained by dissolving I (0.15 g) in a mixture solvent of methanol (30 ml) and dichloromethane (20 ml) and evaporating the solvent slowly at room temperature for about 2 d.

Refinement

H atoms were positioned geometrically, with O—H = 0.82 and C—H = 0.93 Å for aromatic H, and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C}/\text{O})$, where $x = 1.2$ for aromatic H and $x = 1.5$ for other H.

Figures

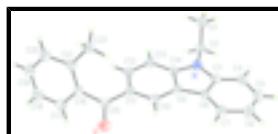

Fig. 1. The molecular structure of the title compound, showing displacement ellipsoids drawn at the 30% probability level.

supplementary materials

Fig. 2. π — π and C—H \cdots π interactions (dotted lines) in the title compound. Cg denotes ring centroid. [Symmetry code: (i) $-x+1, y-1/2, -z+1/2$; (ii) $-x, -y+1, -z$ (iii) $-x+1, -y+1, -z+1$; (iv) $x+1, y+1/2, -z+1/2$; (v) $x, -y+1/2, z+1/2$.]

 methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
