

## 4-(4-Pyridylamino)pyridinium perchlorate

Gregory A. Farnum and Robert L. LaDucca\*

Lyman Briggs College, Department of Chemistry, Michigan State University, East Lansing, MI 48825, USA  
Correspondence e-mail: laducca@msu.edu

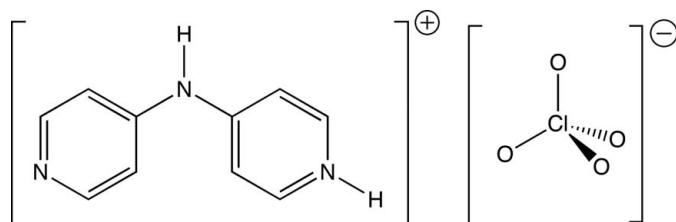

Received 26 January 2009; accepted 27 January 2009

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å; disorder in solvent or counterion;  $R$  factor = 0.037;  $wR$  factor = 0.096; data-to-parameter ratio = 13.9.

In the title salt,  $\text{C}_{10}\text{H}_{10}\text{N}_3^+\cdot\text{ClO}_4^-$ , the 4-(4-pyridylamino)-pyridinium cations are linked into chains via  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bonding and into layers by  $\text{C}-\text{H}\cdots\pi$  interactions [ $\text{C}\cdots\text{Cg} = 3.3875$  (19) Å]. Perchlorate ions are anchored to the layer motifs by  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonding. The perchlorate anion was found to be disordered about a  $\text{Cl}-\text{O}$  axis, with two sites, each of equal occupancy, being resolved for the three remaining O atoms.

## 4-(4-Pyridylamino)pyridinium perchlorate

G. A. Farnum and R. L. LaDuka

### Comment

The dipodal tethering ligand 4,4'-dipyridylamine (dpa) has proven beneficial for the construction of divalent metal adipate coordination polymers with novel topologies (Montney et al., 2007). In an attempt to probe the effect of alkyl group substitution on coordination polymer structure by using methyladipate, colourless crystals of the title salt (I) were obtained.

The asymmetric unit of (I) comprises a  $\text{Hdpa}^+$  cation and a perchlorate ion, with three of its O atoms disordered equally over two positions (Fig. 1). The  $\text{Hdpa}^+$  cations aggregate into supramolecular chains, aligned along  $\bar{[2}01]$  by means of N—H···N hydrogen bonding interactions between protonated and unprotonated pyridyl rings, Table 1. These chains are organized into layers (Fig. 2), oriented parallel to the ac-plane, and connected by C—H··· $\pi$  interactions between pyridyl rings in neighbouring  $\text{Hdpa}^+$  cations [ $\text{C}1\text{---H}1\cdots\text{Cg(N}2,\text{C}6\text{---C}10\text{)}^i = 2.82 \text{ \AA}$ ,  $\text{C}1\cdots\text{Cg}^i = 3.3875(19) \text{ \AA}$  with angle at H1 =  $119^\circ$  for  $i = -1+x, y, z$ ]. Supramolecular interactions are optimized by the  $33.77(8)^\circ$  torsion angle between the pyridyl rings. Perchlorate anions are anchored to the layer motifs by N—H···O hydrogen bonding; the layers stack along the b-direction (Fig. 3)

### Experimental

All chemicals were obtained commercially. Cadmium perchlorate hydrate (20 mg, 0.064 mmol) and methyladipic acid (10 mg, 0.064 mmol) were dissolved in water (1.5 ml) in a glass vial. A 0.75 ml aliquot of a 1:1 water:ethanol mixture was carefully layered onto the aqueous solution, followed by an ethanolic solution (1.5 ml) of 4,4'-dipyridylamine (22 mg, 0.12 mmol). Colourless blocks of the title salt formed after 2 weeks.

### Refinement

All H atoms bound to C atoms were placed in calculated positions, with C—H = 0.95 Å and refined in riding mode with  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$ . The H atoms bound to N atoms were found via a Fourier difference map, restrained with N—H = 0.85 (2) Å, and refined with  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{N})$ . The perchlorate was disordered about a Cl—O axis with two sites, each of equal occupancy, being resolved for the three remaining O atoms. All atoms of the disordered model were refined anisotropically.

### Figures

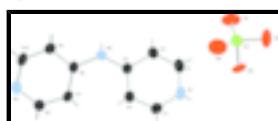

Fig. 1. The asymmetric unit of (I), showing 50% probability ellipsoids and atom numbering scheme. H atom positions are shown as grey sticks. Only one of the disordered set of perchlorate positions is shown. Colour code: green Cl, light blue N, red O, black C.

## supplementary materials

#### Crystal data

$C_{10}H_{10}N_3^+\cdot ClO_4^-$	$F_{000} = 560$
$M_r = 271.66$	$D_x = 1.538 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation
Hall symbol: -P 2ybc	$\lambda = 0.71073 \text{ \AA}$
$a = 7.6254 (10) \text{ \AA}$	Cell parameters from 12615 reflections
$b = 15.991 (2) \text{ \AA}$	$\theta = 2.5\text{--}28.3^\circ$
$c = 9.8358 (13) \text{ \AA}$	$\mu = 0.34 \text{ mm}^{-1}$
$\beta = 101.913 (1)^\circ$	$T = 173 (2) \text{ K}$
$V = 1173.5 (3) \text{ \AA}^3$	Block, colourless
$Z = 4$	$0.36 \times 0.24 \times 0.18 \text{ mm}$

#### Data collection

Bruker SMART 1K diffractometer	2728 independent reflections
Radiation source: fine-focus sealed tube	2165 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.039$
$T = 173(2) \text{ K}$	$\theta_{\text{max}} = 28.3^\circ$
$\omega$ scans	$\theta_{\text{min}} = 2.5^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 2007)	$h = -9 \rightarrow 9$
$T_{\text{min}} = 0.907, T_{\text{max}} = 0.941$	$k = -20 \rightarrow 20$
12615 measured reflections	$l = -12 \rightarrow 12$

#### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
---------------------	--

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.096$	$w = 1/[\sigma^2(F_o^2) + (0.0377P)^2 + 0.7438P]$
$S = 1.03$	where $P = (F_o^2 + 2F_c^2)/3$
2728 reflections	$(\Delta/\sigma)_{\max} < 0.001$
196 parameters	$\Delta\rho_{\max} = 0.39 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.32 \text{ e \AA}^{-3}$
	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

<i>D</i> —H··· <i>A</i>	<i>D</i> —H	H··· <i>A</i>	<i>D</i> ··· <i>A</i>	<i>D</i> —H··· <i>A</i>
N1—H1N···N3 <sup>i</sup>	0.85 (2)	2.04 (2)	2.839 (2)	157 (2)
N2—H2N···O3A <sup>ii</sup>	0.85 (2)	2.17 (2)	2.873 (8)	140.2 (18)
N2—H2N···O4 <sup>ii</sup>	0.85 (2)	2.27 (2)	3.098 (5)	166.1 (19)

Symmetry codes: (i)  $x-1, -y+1/2, z+1/2$ ; (ii)  $-x+1, -y+1, -z+1$ .
