Received 17 January 2009; accepted 23 February 2009

Key indicators: single-crystal X-ray study;  $T = 113\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$ ;  $R$  factor = 0.068;  $wR$  factor = 0.211; data-to-parameter ratio = 11.6.

In the title compound,  $[\text{Ni}(\text{C}_{12}\text{H}_7\text{N}_2\text{O}_4)_2] \cdot 4\text{H}_2\text{O}$ , the Ni atom is located at the centre of a distorted octahedron, formed by four N atoms and two O atoms from the same two tridentating chelated 6-carboxy-2,2'-bipyridine-6'-carboxylate ( $L$ ) ligands. Face-to-face  $\pi$ -stacking interactions between inversion-related pyridine rings with centroid–centroid distances of 3.548 (3) and 3.662 (3)  $\text{\AA}$  (perpendicular distances between the respective rings are 3.314 and 3.438  $\text{\AA}$ ) are found. Intermolecular O—H $\cdots$ O hydrogen bonds between water molecules and  $L$  ligands form  $R_5^3(10)$ ,  $R_6^5(14)$  and  $R_5^5(12)$  rings and also a centrosymmetric cage-like unit of water molecules, which link eight adjacent  $\text{Ni}^{II}$  centers, forming a three-dimensional framework.

## Bis(6'-carboxy-2,2'-bipyridine-6-carboxylato- $\kappa^3N,N',O^6$ )nickel(II) tetrahydrate

**H. Wang, H. Su, J. Xu, F. Bai and Y. Gao**

### Comment

Pyridylcarboxylic acid is the 'ligand star' in coordination chemistry at all times (Gao *et al.*, 2006). Many multidentate ligands containing N- or O-donors, such as pyridine-2,6-dicarboxylic acid (Liu *et al.*, 2008), 2,2'-dipyridine-4,4'-dicarboxylic acid (Law *et al.*, 2007), 2,2'-dipyridine-5,5'-dicarboxylic acid (Szeto *et al.*, 2006) have been widely used because of their diverse coordination modes, which make the final architecture turn more stable and fascinating. Furthermore, they also offer more supramolecule contacts, such as hydrogen bonding or  $\pi\cdots\pi$  stacking interactions, which further make the whole framework more stable (Robin & Fromm, 2006). However, a complex with the title ligand is still rare (Bünzli *et al.*, 2000; Knight *et al.*, 2006).

The molecule of the title complex (Fig. 1), shows that the Ni atom is located at the centre of a distorted octahedron of six coordinating atoms, four N atoms and two O atoms from the same two tridentating chelated 6-carboxy-2,2'-bipyridine-6'-carboxylate ligands L. The coordinated bipyridine fragments are nearly coplanar [torsion angles = 0.1 (7) and 3.5 (6) $^\circ$ , Table 1].

Three different hydrogen-bond ring patterns (see Table 2) are found in the structure:  $R_5^3$ (10) (formed by O9-H9A..O10-H10A..O2..H12A-O12-H12B..O6..H9B-);  $R_6^5$ (14) (formed by O11-H11B..O12-H12A..O2..H10A-O10-H10B..O5-C13-O6..H9B-O9..H11A-); and  $R_5^5$ (12) (formed by O11-H11B..O12-H12B..O6-C13-O5..H10B-O10..H9A-O9..H11A-) (Bernstein *et al.*, 1995). The intermolecular O—H $\cdots$ O hydrogen bonded cage-like units (assisted by the ligands L (Fig.2) and consisted of three different hydrogen-bond ring patterns), with four intermolecular hydrogen bonds, two O3—H3 $\cdots$ O9 and two O7—H7 $\cdots$ O11v (with H-bond patterns D, Bernstein *et al.*, 1995), link eight adjacent NiII centers to form a three-dimensional framework (Fig.3). Face-to-face  $\pi$ -stacking interactions between inversion related pyridine rings with Cg5 $\cdots$ Cg6<sup>vi</sup> and Cg7 $\cdots$ Cg8<sup>iv</sup> distances of 3.548 (3) and 3.662 (3) Å (perpendicular distances between the respective rings are 3.314 and 3.438 Å) make the title compound more stable. Cg5, Cg6, Cg7, and Cg8 are the centroids of the pyridine rings (N1, C2 - C6), (N2, C7 - C11), (N3, C14 - C18) and (N4, C19 - C23), respectively. Symmetry codes: (vi) = -x, -y, -z, and (iv) = 1 - x, 1 - y, 1 - z, see Fig. 1.

### Experimental

The title compound was obtained by the reaction of the mixture of Ni(NO<sub>3</sub>)<sub>2</sub>.6H<sub>2</sub>O, and 2,2'-dipyridine-6,6'-dicarboxylic acid in a molar ratio of 1:0.8 and 10 ml of water under hydrothermal conditions (at 413 K for 6 days and cooled to room temperature with a 5°C h<sup>-1</sup> rate). The green block crystals were washed by water, ethanol. (Yield: 68%)

## Refinement

The H atoms were placed in geometrically idealized positions ( $C-H = 0.95 \text{ \AA}$  and  $O-H = 0.82-0.84 \text{ \AA}$ ), with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ .

## Figures

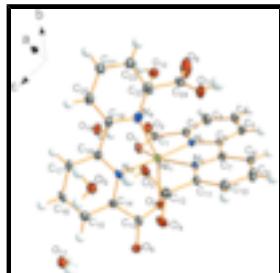

Fig. 1. The molecule structure of the title compound, with atom labels and 50% probability displacement ellipsoids.

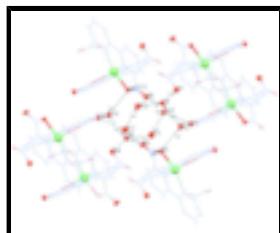

Fig. 2. The ligand assisted hydrogen-bond cage like unit in the compound. The two complex units linked with O11 atoms and all the H atoms, have been omitted for clarity.

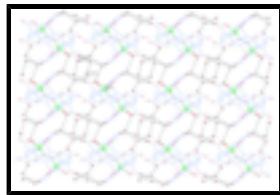

Fig. 3. The packing of the title compound showing hydrogen bonds (dashed lines) holding the molecules together in the crystal structure. The two complex units linked with O11 atoms and all the H atoms, have been omitted for clarity.

## *Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.068$	H-atom parameters constrained
$wR(F^2) = 0.211$	$w = 1/[\sigma^2(F_o^2) + (0.1025P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\text{max}} < 0.001$
4305 reflections	$\Delta\rho_{\text{max}} = 0.96 \text{ e \AA}^{-3}$
372 parameters	$\Delta\rho_{\text{min}} = -0.75 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
