Received 3 February 2009; accepted 11 February 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.047; wR factor = 0.132; data-to-parameter ratio = 14.6.

In the title compound, $\text{C}_{16}\text{H}_{17}\text{N}_3\text{O}_2$, symmetry-related molecules are linked into one-dimensional chains along the a axis by a combination of intermolecular $\text{O}-\text{H}\cdots\text{N}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds and weak $\pi-\pi$ stacking interactions with a centroid–centroid distance of $3.5494(12)\text{ \AA}$.

Related literature

For recent crystal structure reports on the complexes formed with derivatives of 1,10-phenanthroline, see for example: Li *et al.* (2008) and Zhang *et al.* (2008).

X. Jin and J. M. Li

Comment

Derivatives of 1,10-phenanthroline play a vital role in a modern coordination chemistry and a number of complexes have been published with these types of compounds as ligands [see for example the recent publications by Li *et al.* (2008) and Zhang *et al.* (2008)]. An interest in designing new derivatives led to the synthesis the title compound, (I), and its crystal structure is reported herein.

The molecular structure of (I) is shown in Fig. 1. In the crystal structure, intermolecular O—H···N and O—H···O hydrogen bonds (see Table 1) connect symmetry related molecules to form 1-D chains along the *a* axis (see Fig. 2). In addition, within these chain there are weak π – π stacking interactions between symmetry related pyridyl rings, with the relevant distances being $Cg1 \cdots Cg2^{iii} = 3.5494(12)$ Å, $Cg1 \cdots Cg2^{iii}_{\text{perp}} = 3.464$ Å and $\alpha = 1.48^\circ$ [symmetry code (iii) $1+x, y, z$; $Cg1$ and $Cg2$ are the centroids of the C6C7C10-C12/N1 and C1—C5/N2 rings, respectively; $Cg1 \cdots Cg2^{iii}_{\text{perp}}$ is the perpendicular distance from ring $Cg1$ to ring $Cg2^{iii}$; α is the dihedral angle between ring plane $Cg1$ and ring plane $Cg2^{iii}$].

Experimental

2-Diethanolamine-1,10-phenanthroline (0.0523 g, 0.185 mmol) was dissolved into 10 ml methanol and the yellow single crystals were obtained after the solution had been allowed to stand at room temperature for one week.

Refinement

The H atoms of hydroxyl groups were found in a difference Fourier map and were included in 'as found' positions with $d(O—H) = 0.83$ & 0.91 Å; all other H atoms were placed in calculated positions with $C—H = 0.93$ – 0.97 Å. All H atoms were refined as riding, with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ for hydroxyl group and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for other groups.

Figures

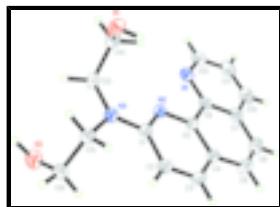

Fig. 1. The molecular structure of (I), showing the atom numbering scheme with thermal ellipsoids drawn at the 30% probability level

supplementary materials

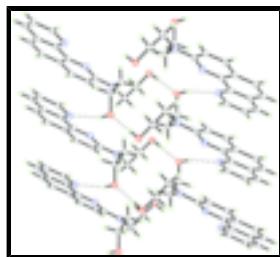

Fig. 2. Part of the crystal structure of (I) showing hydrogen bonds (dashed lines) between symmetry related molecules which form a one-dimensional chain along the a axis.

$Z = 4$	$0.54 \times 0.32 \times 0.20 \text{ mm}$

Data collection

Bruker SMART APEX CCD diffractometer	2765 independent reflections
Radiation source: fine-focus sealed tube	2149 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.030$
$T = 298 \text{ K}$	$\theta_{\text{max}} = 26.5^\circ$
φ and ω scans	$\theta_{\text{min}} = 1.8^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -5 \rightarrow 6$
$T_{\text{min}} = 0.951, T_{\text{max}} = 0.982$	$k = -12 \rightarrow 18$
7520 measured reflections	$l = -23 \rightarrow 23$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.047$	H-atom parameters constrained
$wR(F^2) = 0.132$	$w = 1/[\sigma^2(F_o^2) + (0.0762P)^2 + 0.108P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\text{max}} = 0.008$
2765 reflections	$\Delta\rho_{\text{max}} = 0.24 \text{ e \AA}^{-3}$

190 parameters $\Delta\rho_{\min} = -0.16 \text{ e } \text{\AA}^{-3}$
 Primary atom site location: structure-invariant direct Extinction correction: none
 methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
