Received 14 February 2009; accepted 16 February 2009

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.057; wR factor = 0.231; data-to-parameter ratio = 12.9.

In the title compound, $\text{C}_9\text{H}_{12}\text{NO}_6\text{P}$, intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds form five- and six-membered rings. In the crystal, inversion dimers lined by pairs of $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds occur with ring motifs $R_2^2(10)$. The O atom of the hydroxy group behaves as an acceptor and the benzene ring as donor. Adjacent dimers are connected through $\text{O}-\text{H}\cdots\text{O}$ links.

Dimethyl [hydroxy(2-nitrophenyl)methyl]phosphonate

M. N. Tahir, N. Acar, H. Yilmaz, M. I. Tariq and D. Ülkü

Comment

(*R*)-Dimethyl [(2-chlorophenyl)hydroxymethyl]phosphonate (Tahir *et al.*, 2007) and Dimethyl (1-hydroxy-1,2-diphenylethyl)phosphonate (Acar *et al.*, 2009) have been reported by us. In continuation to the study of phosphonate compounds, we herein report the preparation and crystal structure of the title compound (I), (Fig 1).

Diethyl [hydroxy(2-nitrophenyl)methyl]phosphonate (II) (Chen *et al.*, 2008) have also been published which have similar coordination around the C-atom having α -hydroxy group. But it is observed that the change of diethylphosphonate (II) with dimethylphosphonate (I) results in the S-conformation at the methine. In (I), the P=O is 1.467 (2) Å, whereas P–O and P–C have values of [1.557 (2), 1.563 (2) Å] and 1.829 (2) Å, respectively. The nitro group is oriented at an angle of 27.96 (23) $^{\circ}$ with the benzene ring A(C1—C6). There exist two intramolecular H-bondings which form five B(O1/C7/C1/C6/H6···O1) and six C(O2/N1/C2/C1/C7/H7···O2) membered rings. The title compound is dimerized (Fig 2) forming ring motifs R_2^2 (10) (Bernstein *et al.*, 1995) if only intermolecular H-bonding is concerned. This ten membered ring is splitted into three rings through intramolecular H-bonding resulting in the formation of central four membered ring [O···H···O···H···O]. A similar ring has already been observed in 3-[(methylcarbamoyl)amino]-1*H*-isoindolium chloride (Maliha *et al.*, 2009). The O-atom of hydroxy group behaves as an acceptor and the benzene ring as donar. The adjacent dimers are connected through intermolecular H-bonds of O–H···O type, where the accepter is doubly bonded O the phosphonate group.

Experimental

A solution of *O*-nitrobenzaldehyde (3.01 g, 20 mmole) and dimethylphosphonate (2.20 g, 20 mmole) was prepared in THF (50 ml). To this solution, a powder mixture of an equal amount of KF and commercial Al₂O₃ (2.5 g + 2.5 g) was added slowly and stirred for 48 h at 273 K. The product was filtered and the filtrate was evaporated at room temperature. The crystalline material obtained after two days was washed with ether and recrystallized in a solution mixture of petroleum ether and THF(1:1), [m.p: 383 K].

Refinement

All H-atoms appeared in Difference Fourier Map. The coordinations of the atom H7 bounded to the atom C7 and the atom H1 of the hydroxyl group were refined isotropically.

Thermal parameter of these H atoms was taken 1.2 and 1.5 times of the corresponding atoms, respectively.

The H atom (H7) bound to the atom C7 and the H atom (H1) of the hydroxyl group were located in a difference map and their positions refined, with C—H = 0.93 (3) Å and 0.87 (3) Å. The other H atoms were positioned with idealized geometry and refined using a riding model, with C—H distances 0.93–0.96 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the U_{eq} of the parent atom). For methyl and hydroxyl group $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}$.

supplementary materials

Figures

Fig. 1. *ORTEP* drawing of the title compound, ($C_9H_{12}NO_6P$), with the atom numbering scheme. The thermal ellipsoids are drawn at the 50% probability level. H-atoms are shown by small circles of arbitrary radii. The broken lines indicate the intermolecular H-bondings.

Fig. 2. The partial packing figure (*PLATON*: Spek, 2009) shows the formation of ring motifs through hydrogen bonding.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
---------------------	--

Least-squares matrix: full

$$R[F^2 > 2\sigma(F^2)] = 0.057$$

$$wR(F^2) = 0.231$$

$$S = 1.00$$

2093 reflections

162 parameters

Secondary atom site location: difference Fourier map

H atoms treated by a mixture of independent and constrained refinement

$$w = 1/[\sigma^2(F_o^2) + (0.199P)^2 + 0.3221P]$$

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

$$(\Delta/\sigma)_{\max} < 0.001$$

$$\Delta\rho_{\max} = 0.70 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.50 \text{ e \AA}^{-3}$$

Special details

Experimental. the structure was solved by Patterson method using *SHELX86* (Sheldrick, 2008); the whole molecule was recognized

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles
