Received 19 February 2009; accepted 19 February 2009

Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.037; wR factor = 0.102; data-to-parameter ratio = 15.1.

The molecule of accanthomine A, $\text{C}_{15}\text{H}_{13}\text{N}_5$, is approximately planar, with the indolyl fused-ring and the pyrimidyl ring being twisted by $31.7(1)^\circ$. The amino group of the five-membered ring is an intramolecular hydrogen-bond donor to a nitrogen acceptor of the pyrimide ring. The amino group of the pyrimide ring is a hydrogen-bond donor to the N atoms of adjacent molecules. These hydrogen-bonding interactions give rise to a layered network with a 4.8^2 topology.

Related literature

The β -carboline fragment is found in the crystal structures of two compounds that show selective CDK4-cyclin D1 inhibitory activity; see: García *et al.* (2006). For related compounds, see: Costa *et al.* (2006); Kobayashi *et al.* (1995).

Comment

The molecule of Accanthomine A (I) is approximately planar; the amino group of the five-membered ring is hydrogen-bond donor to a nitrogen acceptor of the pyrimidyl ring (Fig. 1). The amino group of the pyrimidyl ring is a hydrogen-bond donor to the nitrogen atoms of adjacent molecules. The hydrogen bonding interactions give rise to a layer network with a 4.8 (2) topology (Fig. 2).

Experimental

Litsea machilifolia was collected from the Mukim Telang Reserve, Kuala Lipis, Pahang. Specimens (KL5459) were deposited at the herbarium, Department of Chemistry, University of Malaya.

Dried and grounded leaves of *Litsea machilifolia* (2.1 kg) were extracted with dichloromethane. The dichloromethane extract was concentrated under reduced pressure to a volume of 500 ml and this was repeatedly extracted with 5% hydrochloric acid. The combined extracts were then basified with 10% ammonium hydroxide to a pH 11, and then re-extracted with dichloromethane. The crude alkaloid fraction was dark brown (4.0 g). A portion (4.0 g) was subjected to column chromatography on silica gel 60 GF₂₅₄ by using a step gradient of dichloromethane and methanol. One of the fractions when further purified by CC with 100% dichloromethane afforded the pure compound, accanthomine A (8 mg), whose formulation was established by NMR spectroscopic analysis.

Refinement

Carbon-bound H-atoms were placed in calculated positions (C–H 0.95–0.99 Å) and were included in the refinement in the riding model approximation, with $U(\text{H})$ set to $1.2U(\text{C})$. The nitrogen-bound H-atoms were located in a difference Fourier map, and were refined with a distance restraint of N–H 0.88 ± 0.01 Å; their temperature factors were freely refined.

Figures

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of $\text{C}_{15}\text{H}_{13}\text{N}_3$ at the 70% probability level. Hydrogen atoms are drawn as spheres of arbitrary radius.

Hydrogen-bond geometry (\AA , $^\circ$)

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
N1—H11 \cdots N2 ⁱ	0.89 (2)	2.14 (2)	2.994 (3)	161 (3)
N1—H12 \cdots N5 ⁱⁱ	0.91 (3)	2.25 (3)	3.138 (3)	165 (3)
N4—H4 \cdots N3	0.88 (2)	2.29 (3)	2.825 (3)	119 (2)

Symmetry codes: (i) $x, -y+3/2, z-1/2$; (ii) $-x+1, y+1/2, -z+3/2$.
