Received 21 February 2009; accepted 23 February 2009

Key indicators: single-crystal X-ray study;  $T = 295\text{ K}$ ; mean  $\sigma(\text{l}) = 0.000\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.037;  $wR$  factor = 0.103; data-to-parameter ratio = 8.0.

In the title compound,  $C_{15}H_{15}NO$ , the amide fragment has an *anti* conformation. The central amide group is tilted with respect to the benzoyl ring, forming a dihedral angle of  $32.3(5)^\circ$ . The benzoyl and aniline rings make a dihedral angle of  $59.6(5)^\circ$ . Molecules are linked into infinite supramolecular chains via  $N-\text{H}\cdots\text{O}$  hydrogen bonds. The molecule is disordered so that the aromatic rings are disposed across a twofold axis with equal occupancies.

## 4-Methyl-N-(4-methylphenyl)benzamide

B. T. Gowda, M. Tokarcík, J. Kozísek, U. Chaithanya and H. Fuess

### Comment

In the present work, as part of a study of the substituent effects on the structures of benzanilides (Gowda *et al.*, 2003; Gowda *et al.*, 2008*a,b*), the structure of 4-methyl-*N*-(4-methylphenyl)benzamide (**I**) has been determined. The amide adopts an anti-conformation (Fig. 1), similar to that observed in *N*-(4-methylphenyl)benzamide (N4MPBA) (Gowda *et al.*, 2008*a*), 4-methyl-*N*-(phenyl)benzamide (NP4MBA) (Gowda *et al.*, 2009), 2-methyl-*N*-(4-methylphenyl)benzamide (N4MP2MBA) (Gowda *et al.*, 2008*b*) and other benzanilides (Gowda *et al.*, 2003). The central amide group is tilted to the benzoyl ring at an angle of 32.3 (5) $^{\circ}$ , compared to the values of 20.7 (2) $^{\circ}$ , 33.9 (14) $^{\circ}$ , 60.0 (1) $^{\circ}$ , observed for N4MPBA, NP4MBA and N4MP2MBA, respectively. The two aromatic rings form a dihedral angle of 59.6 (5) $^{\circ}$ , in comparison with the values in the structures cited above of 63.4 (1) $^{\circ}$ , 61.0 (1) $^{\circ}$ , and 81.4 (1) $^{\circ}$ , respectively. The molecules are linked by N—H $\cdots$ O hydrogen bonds (Table 1) into supramolecular chains running along the *b* axis (Fig. 2).

### Experimental

Compound (**I**) was prepared according to the method described by Gowda *et al.* (2003). Plate-like colourless single crystals were obtained by slow evaporation from an ethanol solution (ca. 30 ml) of (**I**) (0.5 g) held at room temperature.

### Refinement

H atoms attached to C atoms were placed in calculated positions and refined in the riding model approximation with C—H distances of 0.93 or 0.96 Å. The position of amide-H was refined; N—H = 0.883 (15) Å. The  $U_{\text{iso}}(\text{H})$  values were set at 1.2  $U_{\text{eq}}(\text{C-aromatic}, \text{N})$  and 1.5  $U_{\text{eq}}(\text{C-methyl})$ . The structure was found to be disordered in space group C2/c. The amide-O and -H atoms lie on a 2-fold axis with the aromatic rings disordered about this axis with equal occupancies. The geometries of the rings were restrained using the SADI and FLAT commands and the anisotropic displacement parameters were restrained with the DELU command in SHELXL-97 (Sheldrick, 2008). The atoms of the aniline moiety exhibit large thermal motion which accounts for the low value of the average ring bond distance of 1.359 (6) Å.

### Figures

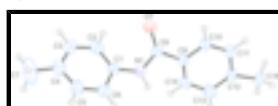

Fig. 1. Molecular structure of (**I**) showing the atom labelling scheme and one orientation of the disordered molecule. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii.

### Crystal data

$\text{C}_{15}\text{H}_{15}\text{NO}$	$F_{000} = 480$
$M_r = 225.28$	$D_x = 1.209 \text{ Mg m}^{-3}$
Monoclinic, $C2/c$	Mo $K\alpha$ radiation
Hall symbol: -C 2yc	$\lambda = 0.71073 \text{ \AA}$
$a = 13.3236 (5) \text{ \AA}$	Cell parameters from 2932 reflections
$b = 5.3591 (2) \text{ \AA}$	$\theta = 3.2\text{--}29.2^\circ$
$c = 17.3525 (6) \text{ \AA}$	$\mu = 0.08 \text{ mm}^{-1}$
$\beta = 92.248 (3)^\circ$	$T = 295 \text{ K}$
$V = 1238.06 (8) \text{ \AA}^3$	Plate, colorless
$Z = 4$	$0.26 \times 0.25 \times 0.07 \text{ mm}$

### Data collection

Oxford Diffraction Xcalibur System diffractometer	1235 independent reflections
Monochromator: graphite	775 reflections with $I > 2\sigma(I)$
Detector resolution: 10.434 pixels $\text{mm}^{-1}$	$R_{\text{int}} = 0.029$
$T = 295 \text{ K}$	$\theta_{\text{max}} = 26.2^\circ$
$\omega$ scans with $\kappa$ offsets	$\theta_{\text{min}} = 3.8^\circ$
Absorption correction: multi-scan (CrysAlis RED; Oxford Diffraction, 2007)	$h = -16\rightarrow 16$
$T_{\text{min}} = 0.984$ , $T_{\text{max}} = 0.995$	$k = -6\rightarrow 6$
8166 measured reflections	$l = -21\rightarrow 21$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.103$	$w = [\exp(0.90(\sin\theta/\lambda)^2)]/[\sigma^2(F_o^2) + (0.068P)^2]$
$S = 0.99$	where $P = 0.33333F_o^2 + 0.66667F_c^2$
	$(\Delta/\sigma)_{\text{max}} < 0.001$

1235 reflections  $\Delta\rho_{\max} = 0.12 \text{ e } \text{\AA}^{-3}$   
 154 parameters  $\Delta\rho_{\min} = -0.12 \text{ e } \text{\AA}^{-3}$   
 59 restraints Extinction correction: none  
 Primary atom site location: structure-invariant direct methods

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
