Received 20 January 2009; accepted 3 March 2009

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.033;  $wR$  factor = 0.087; data-to-parameter ratio = 11.5.

In the title compound,  $[\text{Co}(\text{C}_6\text{H}_6\text{N}_4)_2(\text{H}_2\text{O})_2](\text{C}_{16}\text{H}_8\text{O}_8)$ , the  $\text{Co}^{II}$  cation and the organic anion occupy different crystallographic inversion centres and, as a consequence, the asymmetric unit comprises two half-molecules. The benzene groups are coplanar. The four coordinating N atoms of the two bidentate biimidazole ligands define the equatorial plane of a slightly distorted octahedral  $\text{CoO}_2\text{N}_4$  geometry, and the water O atoms lie in the axial coordination sites. Translational ( $a, \bar{b}$ ) and inversion-related symmetry operations link the Co complex molecules and the negatively charged carboxylate anions via intermolecular  $\text{N}-\text{H}\cdots\text{O}$  and  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds into sheets parallel to  $(\bar{1}01)$ . The coordinated water molecules connect the sheets through  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds, forming a three-dimensional framework. In addition, two intramolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds are observed between the carboxyl and carboxylate groups.

### Comment

Design and construction of metal-organic frameworks (MOFs) have attracted considerable attention in recent years, not only for their intriguing structural motifs (Wang *et al.* 2007), but also for their potential applications, e. g. as organic-inorganic hybrid materials (Hagrman *et al.*, 1999), highly porous metal-organic framework (Li *et al.*, 1999), magnetochemistry (Jia *et al.*, 2007). In contrast, the two ionic components of the title structure interact with N—H···O and O—H···O hydrogen bonds to form a three-dimensional framework.

As shown in Fig. 1, the Co atom (site symmetry  $\bar{1}$ ) is bonded to two aqua and two bidentate biimidazole ligands, to result in a slightly distorted octahedral  $\text{CoO}_2\text{N}_4$  geometry for the central metal. The  $\text{Co}^{\text{II}}$  cation and the organic anion occupy different crystallographic inversion centres, and as a consequence the asymmetric unit of the cell comprises two half molecules ( $Z' = 1/2$ ), and the benzene groups are co-planar. The four nitrogen atoms belonging to two biimidazole ligands lie in the equatorial plane and the two aqua oxygen atoms lie in the axial coordination sites. Selected bond lengths and angles around Co are listed in Table 1. The 1,1'-biphenyl-3,3'-dicarboxylate-4,4'-dicarboxylic acid acts as a negative electron balance. With three kinds of hydrogen bonds (Table 2) of  $\text{N}2-\text{H}2\text{A}\cdots\text{O}1$ ,  $\text{N}4-\text{H}4\text{A}\cdots\text{O}2$ , and  $\text{O}5-\text{H}1\text{W}\cdots\text{O}1$ , two-dimensional planes are formed. Furthermore, a three-dimensional framework (Fig. 2) is generated with the intermolecular hydrogen bonding contact  $\text{O}5-\text{H}2\text{W}\cdots\text{O}4$  along the [-1 0 1] direction. The organic anion has two intramolecular  $\text{O}3-\text{H}3\cdots\text{O}2$  hydrogen bonds between the carboxylic acid units and the carboxylate acceptors (Table 2). In contrast to the co-planar biphenyl group of the title compound, a dihedral angle of 42.30 (11) $^\circ$  between the two benzene rings was observed in the structure of 1,1'-biphenyl-2,3,3',4'-tetracarboxylic acid monohydrate (Jiang *et al.* 2008).

### Experimental

All chemicals and Teflon-lined stainless steel autoclave were purchased from Jinan Henghua Sci. & Tec. Co. Ltd. A mixture of 3,3',4,4'-biphenyl tetracarboxylic acid (0.1 mmol), cobalt(II) acetate (0.1 mmol), and diimidazole (0.1 mmol) in 10 ml distilled water sealed in a 25 ml Teflon-lined stainless steel autoclave was kept at 433 K for three days. Yellow crystals suitable for the X-ray experiment were obtained.

### Refinement

The H atoms of the water molecule were located from difference density maps and were refined with distance restraints of  $d(\text{H}-\text{H}) = 1.38$  (2) Å,  $d(\text{O}-\text{H}) = 0.88$  (2) Å, and with a fixed  $U_{\text{iso}}$  of 0.056 Å<sup>2</sup>. All other H atoms were placed in calculated positions with a C—H bond distance of 0.93 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  of the carrier atom.

## *Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.033$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.087$	$w = 1/[\sigma^2(F_o^2) + (0.045P)^2 + 0.376P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{\text{max}} = 0.001$
2603 reflections	$\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$
227 parameters	$\Delta\rho_{\text{min}} = -0.21 \text{ e \AA}^{-3}$
5 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
