Received 24 February 2009; accepted 25 March 2009

Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.041; wR factor = 0.108; data-to-parameter ratio = 16.8.

The reaction of $\text{Zn}(\text{NO}_3)_2$ with pyridine-2,6-dicarboxylic acid (pydcH_2) and acridine (acr) in aqueous solution leads to the formation of the title compound, $(\text{C}_{13}\text{H}_{10}\text{N})[\text{Zn}(\text{C}_7\text{H}_3\text{NO}_4)(\text{C}_7\text{H}_4\text{NO}_4)] \cdot 5\text{H}_2\text{O}$ or $(\text{acrH})[\text{Zn}(\text{pydcH})(\text{pydc})] \cdot 5\text{H}_2\text{O}$. In the title compound, the Zn^{II} atom is coordinated by four O atoms and two N atoms from the tridentate chelating rings of $(\text{pydc})^{2-}$ and $(\text{pydcH})^-$ anions. The geometry of the resulting ZnN_2O_4 coordination can be described as distorted octahedral. To balance the charges, one protonated acridine (acrH^+) cation is present. In the crystal structure, extensive $\text{O}-\text{H} \cdots \text{O}$ and $\text{N}-\text{H} \cdots \text{O}$ hydrogen bonds involving acrH^+ , the complex anion and uncoordinated water molecules form a three-dimensional network.

Acridinium (6-carboxypyridine-2-carboxylato)(pyridine-2,6-dicarboxylato)zincate(II) pentahydrate

M. Tabatabaee, H. Aghabozorg, J. Attar Gharamaleki and M. A. Sharif

Comment

In the recent years, our research group has been interested in the synthesis of proton transfer compounds and study of their behavior with metal ions. We have focused on the proton delivery from polycarboxylic acids, which are considered as very good donors and amines as acceptors. Among polycarboxylic acids, pyridine-2,6-dicarboxylic acid (pydcH₂) as a very important carboxylate derivative has attracted much interest in coordination chemistry and it is the one that we utilized widely in our studies (Aghabozorg, Attar Gharamaleki *et al.*, 2008; Aghabozorg, Firoozi *et al.*, 2008; Aghabozorg, Manteghi *et al.*, 2008; Tabatabaee *et al.*, 2008; Soleimannejad *et al.*, 2008; Aghabozorg *et al.*, 2009; Safaei-Ghomi *et al.*, 2009). In order to develop novel systems, we wish to report the first complex of Zn^{II} with pyridine-2,6-dicarboxylic acid as proton donor and acridine as proton acceptor.

The title compound consists of [Zn(pydcH)(pydc)]⁻ anion, (acrH)⁺ cation and five uncoordinated water molecules (Fig. 1). Zn^{II} ionic complex includes dianionic ((pydc)²⁻) and monoanionic ((pydcH)⁻) forms of pydcH₂, simultaneously. Zn^{II} atom is six-coordinated by these anions and the geometry of the resulting ZnN₂O₄ coordination can be described as distorted octahedral (Table 1). The N atoms occupy the axial positions. The N1—Zn1—N2 angle (167.38 (8)°) deviates from linearity. The dihedral angle between the mean planes of the pyridine rings (A1 and A2, defined in Fig. 1) is 88.16 (9)° indicating that (pydc)²⁻ and (pydcH)⁻ fragments are almost perpendicular to each other. Zn—N distances of (2.0011 (16)Å and 2.0238 (16)Å and Zn—O distances (Zn1—O1:2.0864 (14)Å, Zn1—O5: 2.1443 (15)Å, Zn1—O3:2.2100 (14)Å and Zn1—O7: 2.3406 (14)Å) are consistent with those found in (pydaH)[Zn(pydcH)(pydc)].3H₂O (Ranjbar *et al.* 2002) and (creatH)[Zn(pydcH)(pydc)].4H₂O (Moghimi *et al.* 2005). There are some hydrogen bonding interactions such as O—H...O and N—H...O between cations, anions and uncoordinated water molecules (Table 2). The water molecules act also as bridging agents and link anions together *via* hydrogen bonds (Fig. 2). As it is seen in Fig. 3, there are also π - π stacking interactions between the aromatic rings of the coordinated (pydc)²⁻ and (pydcH)⁻ anions and acridinium cation, with distances of 3.537 (1)Å for Cg5...Cg7 [Cg5: N1/C1—C5, Cg7:N3/C15—C20—C21—C22—C27] and 3.751 (1)Å for Cg6...Cg7 (Cg6:N2/C8—C12). Ion pairing, hydrogen bonding, π - π stacking and van der Waals interactions are also effective packing for the crystal structure. These interactions lead to formation of a three-dimensional supramolecular structure.

Experimental

An aqueous solution of zinc nitrate (Zn(NO₃)₂ · 6H₂O, (0.15 g, 0.5 mmol) in water (20 ml) was added to a stirring solution of (20 ml) pyridine-2,6-dicarboxylic acid (0.1 g, 0.5 mmol) and 0.25 g (1.5 mmol) acridine. The reaction mixture was stirred at 25°C for 2 h. Colorless crystals of the title compound were obtained after two weeks at room temperature.

Refinement

The H(C) atoms were positioned geometrically and refined in isotropically in riding model with $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$. The H atoms of water molecules, OH and NH groups were located in difference Fourier synthesis and refined isotropically.

Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.35 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
