Received 3 December 2008; accepted 11 March 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.065;  $wR$  factor = 0.170; data-to-parameter ratio = 14.1.

The title compound,  $C_{26}H_{25}Cl_3N_6O_4$ , was prepared by the reaction of (*Z*)-ethyl 3-amino-3-(4-chlorophenyl)-2-cyanoacrylate and 4-chloro-3-ethyl-1-methyl-1*H*-pyrazole-5-carbonyl chloride. The dihedral angles between the chlorobenzene and the two pyrazole rings are 59.8 (2) and 33.3 (2) $^\circ$ . The two pyrazole rings are oriented to each other at a dihedral angle of 84.7 (2) $^\circ$ . The crystal packing is governed by intermolecular C—H···O interactions, resulting in a three-dimensional network. The ethyl groups are disordered over two positions, with site-occupancy factors of 0.71/0.29 and 0.51/0.49.

## (Z)-Ethyl 3-[bis(4-chloro-3-ethyl-1-methyl-1*H*-pyrazol-5-ylcarbonyl)amino]-3-(4-chlorophenyl)-2-cyanopropanoate

D. Zhang, X. Zhang and L. Guo

### Comment

Recently, 2-cyanoacrylates have been in widespread used as agrochemicals because of their unique mechanism of action and good environmental profiles. The title compound is useful as an inhibitor of Pyricularia oryzae, Rhizoctonia solani, Botrytis cinerea and Gibberella zeae (Heller *et al.*, 2004; Ibers & Hamilton, 1964). In the title compound (Fig. 1), all bond lengths and angles are unexceptional. The planar chlorobenzene ring is approximately perpendicular to one of the pyrazole ring with a dihedral angle of 59.9 (2) $^{\circ}$ . The dihedral angle between this chlorobenzene ring and the other pyrazole rings is 33.3 (12) $^{\circ}$ . The dihedral angle between the two pyrazole rings is 84.7 (2) $^{\circ}$ . The crystal packing is governed by C—H···O intermolecular interactions resulting in a three-dimensional network (Table 1.). The ethyl groups are disordered over two positions, with site-occupancy factors of 0.71/0.29 and 0.51/0.49.

### Experimental

To a solution of (Z)-ethyl 3-amino-3-(4-chlorophenyl)-2-cyanoacrylate (1.25 g, 0.0050 mol) in  $\text{C}_1\text{H}_2\text{Cl}_2$ (18 ml), 4-chloro-3-ethyl-1-methyl- 1*H*-pyrazole-5-carbonyl chloride (3.11 g, 0.015 mol) was added. Subsequently,  $\text{Et}_3\text{N}_1$ (1.52 g, 0.015 mol) was dropped into the solution under stirring. The reaction mixture was then heated to reflux, stirred for 4 h. Subsequently, it was cooled to room temperature. The reaction solution was filtered off and some white solid was separated. The organic phase was washed with water and then dried over  $\text{Na}_2\text{S}_1\text{O}_4$ . After removal of the solvent, a brown dope was obtained. After column chromatogram using ethylacetate/light petroleum (1:6) as the eluent, small single crystals were grown from a solution of ethyl acetate/petroleum ether(3:1) after 45 days, at room temperature.

### Refinement

Methyl H atoms were placed in calculated positions with C—H=0.96 $\text{\AA}$  and the torsion angle was refined to fit the electron density; thermal parameters were refined as  $U_{\text{iso}}(\text{H})=1.5U_{\text{eq}}(\text{C})$ . Other H atoms were placed in calculated positions with C—H =0.96 $\text{\AA}$  (methylene C—H) and 0.93 $\text{\AA}$  (aromatic C—H), and refined in riding mode, with  $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$ .

### Figures

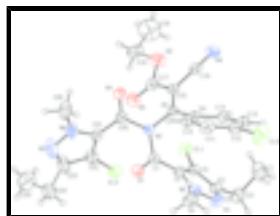

Fig. 1. The molecular structure of the title compound, showing 30% probability displacement ellipsoids and the atom-numbering scheme. Only the higher occupied of the disordered sites is shown.

 methods

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
