Received 16 March 2009; accepted 20 March 2009

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.040; wR factor = 0.092; data-to-parameter ratio = 32.3.

In the title compound, $\text{C}_{20}\text{H}_{16}\text{S}_2$, the pyrene ring is planar [maximum deviation $0.0144(15)\text{ \AA}$] and the dithiane ring adopts a chair conformation. The crystal packing is stabilized by $\text{C}-\text{H}\cdots\pi$ interactions. An intramolecular $\text{C}-\text{H}\cdots\text{S}$ hydrogen bond generates an $S(5)$ ring motif.

2-(Pyrene-1-yl)-1,3-dithiane

H.-K. Fun, S. R. Jebas, A. C. Maity, N. K. Das and S. Goswami

Comment

Thioacetal protection of carbonyl groups is of paramount importance in synthetic organic chemistry and hence the development of novel thionation reactions remains of great interest (Goswami & Maity, 2008; Fun *et al.*, 2009; Goswami *et al.*, 2009). In addition, thioacetals are also utilized as masked acyl anions or masked methylene functions in carbon–carbon bond forming reactions. Here we report the synthesis of 2-pyrene-1-yl-[1,3]dithiane from pyrene-1-aldehyde using $\text{BF}_3\text{--Et}_2\text{O}$ as catalyst and its crystal structure.

The asymmetric unit of (I), (Fig. 1), consists of one molecule of the title compound. The bond lengths (Allen *et al.*, 1987) and bond angles are found to have normal values. The pyrene ring is essentially planar with the maximum deviation from planarity being 0.0144 (15) Å for atom C15. The dithiane group adopts a chair conformation with the puckering parameters $Q = 0.7477$ (12) Å, $\theta = 9.61$ (10)° and $\phi = 66.3$ (5)° (Cremer & Pople, 1975).

The crystal packing is stabilized by C—H \cdots π interactions (Table 1). An intramolecular C—H \cdots S hydrogen bonding generates an S(5) ring motif (Bernstein *et al.*, 1995).

Experimental

To a stirred solution of pyrene-1-aldehyde (500 mg., 2.17 mmol) and boron trifluoride etherate (0.5 ml) in dichloromethane (50 ml) cooled at 273 K is added 1,3-propanedithiol (490 mg, 4.5 mmol) dropwise over 15 min with stirring. The mixture is stirred at room temperature for 3 h. The progress of the reaction is monitored by TLC. After completion of the reaction, NaHCO_3 solution is added slowly and carefully to neutralize the mixture at room temperature which is then extracted with dichloromethane. The organic layer is dried (anhydrous Na_2SO_4) and then the solvent is removed under reduced pressure. The crude product was purified by column chromatography using silica gel with 10% ethyl acetate in pet ether as eluant to afford 2-pyrene-1-yl-[1,3]dithiane (620 mg, 89%) as a colourless crystalline solid along with other thiane derivatives.

Refinement

H atoms were positioned geometrically [$\text{C}—\text{H} = 0.93\text{--}0.98$ Å] and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. 2662 Friedel pairs were used to determine the absolute configuration.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.040$	$w = 1/[\sigma^2(F_o^2) + (0.0461P)^2 + 0.0807P]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.092$	$(\Delta/\sigma)_{\max} < 0.004$
$S = 1.05$	$\Delta\rho_{\max} = 0.48 \text{ e \AA}^{-3}$
6424 reflections	$\Delta\rho_{\min} = -0.27 \text{ e \AA}^{-3}$
199 parameters	Extinction correction: none
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 2662 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: 0.03 (5)

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
