Received 30 March 2009; accepted 31 March 2009

Key indicators: single-crystal X-ray study;  $T = 150\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.023;  $wR$  factor = 0.054; data-to-parameter ratio = 20.5.

Both the cation and anion of the title compound,  $(\text{C}_{26}\text{H}_{21}\text{N}_2)^+[\text{AuCl}_4]$ , are disposed about a plane of mirror symmetry. The 2,9-dimethyl-4,7-diphenyl-1,10-phenanthrolinium ring is oriented at a dihedral angle of  $44.2(1)^\circ$  with respect to the planar phenyl ring systems. The  $\text{Au}^{\text{III}}$  atom has a square-planar environment defined by four Cl atoms. The crystal structure is stabilized by  $\text{C}-\text{H}\cdots\pi$  and  $\text{Au}\cdots\pi$  ring–metal ( $3.551\text{ \AA}$ ) interactions. In the crystal structure, the molecules stack along the  $c$  axis via  $\text{N}-\text{H}\cdots\text{N}$  hydrogen-bond interactions.

### Comment

In recent years, there has been considerable interest in proton transfer systems and their structures (Amani *et al.*, 2008; Abedi *et al.*, 2008; Karaca *et al.*, 2009). Several proton transfer systems using HAuCl<sub>4</sub> with proton acceptor molecules, such as [EMI][AuCl<sub>4</sub>] and [BMI]<sub>2</sub>[AuCl<sub>4</sub>].2H<sub>2</sub>O (Hasan *et al.*, 1999), [H<sub>2</sub>bipy][AuCl<sub>4</sub>][Cl] (Zhang *et al.*, 2006), [H<sub>7</sub>O<sub>3</sub>][15-crown-5][AuCl<sub>4</sub>] and [H<sub>5</sub>O<sub>2</sub>][benzo-15-crown-5]<sub>2</sub>[AuCl<sub>4</sub>] (Johnson & Steed, 1998), [H<sub>5</sub>O<sub>2</sub>]<sub>2</sub>[12-crown-4]<sub>2</sub>[AuCl<sub>4</sub>]<sub>2</sub>, [H<sub>3</sub>O][18-crown-6][AuCl<sub>4</sub>] and [H<sub>3</sub>O][4-nitrobenzo-18-crown-6][AuCl<sub>4</sub>] (Calleja *et al.*, 2001), [DPpy.H][AuCl<sub>4</sub>] (Yap *et al.*, 1995) and [H<sub>2</sub>DA18C6][AuCl<sub>4</sub>].2H<sub>2</sub>O (Hojjat Kashani *et al.*, 2008) [where EMI is 1-ethyl-3-methylimidazolium, BMI is 1-butyl-3-methylimidazolium, H<sub>2</sub>bipy is 2, 2'-bipyridinium, DPpy.H is 2,6-diphenylpyridinium and H<sub>2</sub>DA18C6 is 1,10-diazonia-18-crown-6] have been synthesized and characterized by single-crystal X-ray diffraction methods. We report herein the synthesis and crystal structure of the title compound, (I).

Both the cation and anion of the title compound (Fig. 1) are disposed about a plane of mirror symmetry. The 2,9-dimethyl-4,7-diphenyl-1,10-phenanthroline ring is oriented at a dihedral angle of 44.2 (1)<sup>o</sup> with respect to the planar phenyl ring systems. The Au ion has a square-planar environment defined by four Cl atoms. In AuCl<sub>4</sub> anion, the Au—Cl bond lengths and Cl—Au—Cl bond angles are normal ranges. In the crystal structure, there exist ring-metal interactions [ $Cg2\cdots Au1(x, y, z) = 3.551 \text{ \AA}$  and  $Cg2\cdots Au1(x, 1/2 - y, z) = 3.551 \text{ \AA}$ , where  $Cg2$  is a centroid of the central benzene ring (C5—C7/C5b—C7b) of the cation molecule]. For C1—H1B···Cg3 interaction,  $C1\cdots Cg3 = 3.574 \text{ \AA}$ , where  $Cg3$  is a centroid of the phenyl ring (C8—C13) (Table 2). View of the packing of (I) down the c-axis is given in Fig. 2.

### Experimental

For the preparation of the title compound, a solution of 2,9-dimethyl-4,7-diphenyl-1,10-phenanthroline (0.15 g, 0.44 mmol) in HCCl<sub>3</sub> (10 ml) was added to a solution of HAuCl<sub>4</sub>.3H<sub>2</sub>O, (0.17 g, 0.44 mmol) in ethanol (5 ml) and the resulting yellow solution was stirred for 15 min at 313 K. This solution was left to evaporate slowly at room temperature. After one week, yellow prismatic crystals of the title compound were isolated [yield: 0.23 g; 72.1%; m. p. 495 K].

### Refinement

All H atoms were seen in the difference electron density map. The H atom HN1 bound to atom N1 were refined isotropically. Since the anion group of the title molecule has symmetrically two parts, the site occupation factor of the HN1 atom were fixed at the value of 0.5. The other H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93 and 0.96 Å and with  $U_{iso}(\text{H}) = 1.2$  or  $1.5U_{eq}(\text{C})$ . The highest residual peak is located 0.87 Å from atom Au1 and the deepest hole is located 0.57 Å from atom Au1.

### Data collection

Bruker APEXII CCD diffractometer	3265 independent reflections
Radiation source: sealed tube	2835 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.046$
$T = 150 \text{ K}$	$\theta_{\text{max}} = 29.2^\circ$
$\varphi$ and $\omega$ scans	$\theta_{\text{min}} = 1.8^\circ$
Absorption correction: multi-scan	$h = -18 \rightarrow 18$

(SADABS; Sheldrick, 2003)

$T_{\min} = 0.345$ ,  $T_{\max} = 0.774$

24337 measured reflections

$k = -31 \rightarrow 31$

$l = -10 \rightarrow 10$

### Refinement

Refinement on  $F^2$

Secondary atom site location: difference Fourier map

Least-squares matrix: full

Hydrogen site location: inferred from neighbouring sites

$R[F^2 > 2\sigma(F^2)] = 0.023$

H atoms treated by a mixture of independent and constrained refinement

$wR(F^2) = 0.054$

$$w = 1/[\sigma^2(F_o^2) + (0.026P)^2 + 1.1102P]$$

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

$S = 1.03$

$$(\Delta/\sigma)_{\max} = 0.001$$

3265 reflections

$$\Delta\rho_{\max} = 0.85 \text{ e \AA}^{-3}$$

159 parameters

$$\Delta\rho_{\min} = -0.60 \text{ e \AA}^{-3}$$

Primary atom site location: structure-invariant direct methods

Extinction correction: none

### Special details

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted  $R$ -factors  $wR$  and all goodnesses of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The observed criterion of  $F^2 > \sigma(F^2)$  is used only for calculating - $R$ -factor-obs etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
