

Bis[cis-bis(diphenylphosphino)ethene- κ^2P,P']copper(I) tetrafluoridoborate ethanol solvate

Peter C. Healy,* Bradley T. Loughrey and Michael L. Williams

Eskitis Institute for Cell and Molecular Therapies, Griffith University, Brisbane 4111, Australia

Correspondence e-mail: P.Healy@griffith.edu.au

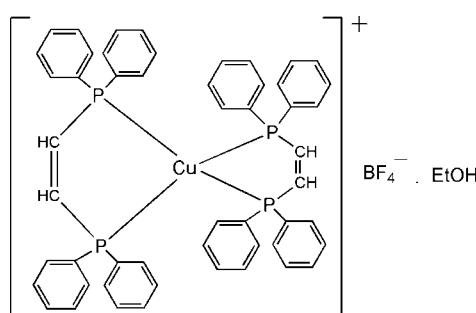

Received 1 April 2009; accepted 3 April 2009

Key indicators: single-crystal X-ray study; $T = 223\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; disorder in solvent or counterion; R factor = 0.041; wR factor = 0.108; data-to-parameter ratio = 14.9.

In the title compound $[\text{Cu}(\text{C}_{26}\text{H}_{22}\text{P}_2)_2]\text{BF}_4 \cdot \text{C}_2\text{H}_5\text{OH}$, a disordered ethanol solvate molecule and the anions are located in well defined channels along the c axis. The four-coordinate $\text{Cu}(\text{P}-\text{P})_2$ core of the cation adopts approximately D_2 point group symmetry with the $\text{Cu}-\text{P}$ bond lengths spanning a narrow range from 2.272 (1) to 2.285 (1) \AA .

Bis[cis-bis(diphenylphosphino)ethene- κ^2P,P']copper(I) tetrafluoridoborate ethanol solvate

P. C. Healy, B. T. Loughrey and M. L. Williams

Comment

Adducts of the bidentate phosphine ligand, Ph₂P(CH=CH)PPh₂ (dppey), with copper, silver and gold(I) salts form stable bis-chelated ionic complexes [M(dppey)₂]X which have been shown to exhibit significant cytotoxic and antitumor activity (Berners-Price *et al.*, 1987; 1985; 1990). In this present study on the synthesis and characterization of copper(I) complexes with this ligand, we have found that addition of aqueous HBF₄ to a suspension of dppey and a slight stoichiometric excess of copper(I) oxide in ethanol results in precipitation of well formed crystals which were shown by ¹H NMR, ES Mass Spectrometry and single-crystal X-ray structural analysis to be [Cu(dppey)₂]BF₄·EtOH. The crystal structure of this complex was found to be isomorphous with the copper(I) and gold(I) PF₆ complexes (Berners-Price *et al.*, 1992). A view of the of the [Cu(dppey)₂]⁺ cation is shown in Fig. 1, with crystal packing viewed down the *c* axis shown in Fig. 2.

In this lattice, the anions and disordered solvent occupy well defined channels along the crystallographic *c* axis, with extensive C—H···F weak bonding interactions between the phenyl and ethene H atoms and the anion fluorides. For the present structure, an O—H···F hydrogen bonding interaction exists between the ethanol hydroxyl proton and the BF₄ anion.

In the Cu(P—P)₂ core of the cation, the Cu—P bond lengths span a narrow range from 2.272 (1) - 2.285 (1) Å and are similar to values of 2.276 (2) - 2.289 (2) Å reported for the PF₆ complex (Berners-Price *et al.*, 1992). The P—Cu—P inter-ligand angles range from 110.08 (4)° to 131.20 (3)° with the P—Cu—P intra-ligand 'bite' angles 89.76 (4) and 89.95 (4)°. In this cation, each ligand adopts a sterically comfortable conformational structure with the phenyl ring planes in each ligand approximately orthogonal to each other, maximizing C—H..π interactions. Charge transfer π···π interactions between phenyl rings of each ligand are likely to contribute to the overall stability of both the cation and the lattice structure.

Angular distortion of the *M(L—L)₂* core of four-coordinate bis(bidentate) complexes can be conveniently described by the parameters θ_x , θ_y and θ_z which define the orientation of the L—M—L plane of ligand 1 with respect to that of ligand 2 (Dobson *et al.*, 1984; Healy *et al.*, 2008). θ_x and θ_y represent rocking motions of the two ligands with respect to each other while θ_z is a measure of the degree of twist between the two planes. For moieties adopting D_{2d} point group symmetry $\theta_x = \theta_y = \theta_z = 90^\circ$. In this present structure, $\theta_x = 90.5^\circ$, $\theta_y = 89.7^\circ$ and $\theta_z = 72.7^\circ$ with the deviation θ_z from 90°, representing a lowering of the point group symmetry of the core from D_{2d} to approximately D₂.

Experimental

1 ml of concentrated aqueous HBF₄ was added to a suspension of Cu₂O (0.02 g, 0.14 mmol) and dppey (0.20 g, 0.50 mmol) in 5 ml ethanol. The resultant mixture was heated with stirring to yield a clear pale green solution. Filtration and cooling to room temperature resulted in formation of a crystalline precipitate. Recrystallization by slow evaporation of an ethanol solution of the complex resulted in well formed crystals suitable for X-ray diffraction studies. NMR: ¹H (d₆DMSO), δ 1.05

supplementary materials

$t, J = 6.8 \text{ Hz}, 3\text{H}, \text{CH}_3$), 3.43 (dq, $J = 7.2 \text{ Hz}, 7.2 \text{ Hz}$ 2H, CH_2), 7.11–7.14 (m, 16H, C_6H_5 *ortho*), 7.16–7.20 (m, 16H, C_6H_5 *meta*), 7.37–7.41 (m, 8H, C_6H_5 *para*), 7.96–8.07 (m, 4H, CH). ESMS (m/z): +ve ion, calcd m/z for $[\text{Cu}(\text{dppey})_2]^+$ 856.46, found 854.95 (100%), -ve ion, calcd m/z for BF_4^- 86.82, found 86.51 (100%). *M.p.* 176–177°C.

Refinement

H atoms attached to carbons were constrained as riding atoms, with C–H set to 0.94–96 Å. The hydroxyl proton placed at a calculated position along O···F axis and constrained as a riding atom with O–H set to 0.88 Å. $U_{\text{iso}}(\text{H})$ values were set to 1.2 U_{eq} of the parent atom. The carbon atoms disordered ethanol molecule were refined isotropically.

Secondary atom site location: difference Fourier map	Flack parameter: -0.003 (12)

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating - R -factor-obs etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
