Received 21 March 2009; accepted 28 March 2009

Key indicators: single-crystal X-ray study; $T = 153\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; disorder in main residue; R factor = 0.043; wR factor = 0.112; data-to-parameter ratio = 14.1.

The title molecule, $\text{C}_{16}\text{H}_{14}\text{N}_4\text{O}$, lies on a crystallographic inversion center. The $-\text{CH}_2-$ groups and the O atom are disordered over two sites with equal occupancy, the disorder of the O atom being symmetry imposed. In the crystal structure, molecules are linked into a two-dimensional network parallel to (001) via intermolecular $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds.

1,3-Bis(1*H*-benzimidazol-2-yl)-2-oxapropane

Y. Chen, J. Guo, R. Yun and H. Wu

Comment

Interest in bis(2-benzimidazolyl)alkanes and their derivatives are widespread and has originated from their wide-ranging anti-viral activity and their importance in selective ion-exchange resins (Cai *et al.*, 2003; Min *et al.*, 2000; Roderick *et al.*, 1972). The molecular structure of the title compound is shown in Fig. 1 and is isostructural with the amine analog (Tarazon Navarro & McKee, 2003). In the crystal structure, molecules are linked into a two-dimensional network parallel to the (001) plane via intermolecular N-H \cdots N hydrogen bonds (Fig. 2).

Experimental

21.44 g (160 mmol) of diglycolic acid was combined with 34.56 g (320 mmol) of *o*-phenylenediamine in 350 ml of 5 N HCl. The solution was refluxed for 24 h. The resulting solution was neutralized with NH₄OH. The white precipitate was collected, washed with MeOH and absolute Et₂O, and dried *in vacuo*. The dried precipitate was dissolved in DMF to a green solution and through the ether diffusion exhalation crystal after three days at room temperature. The colorless crystals suitable for X-ray diffraction studies were obtained after four weeks. Yield, 29.36 g (66%). (found: C, 68.78; H, 5.09; N, 20.51 Calcd. for C₁₆H₁₄N₄O: C, 69.05; H, 5.07; N, 20.13)

Refinement

H atoms were included in calculated positions and refined in a riding-model approximation with C—H distances ranging from 0.95 to 0.96 Å and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. The H atom bonded to N2 was refined independently with an isotropic displacement parameter. The -CH₂ groups and the O atom are disordered over two sites with equal occupancy, the disorder of the O atom being symmetry imposed. The anisotropic displacement parameters of C8 and C8* were constrained to be equal using the EADP instruction in SHELXL (Sheldrick, 2008).

Figures

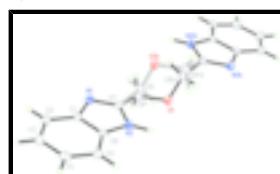

Fig. 1. The molecular structure of the title compound with displacement ellipsoids shown at the 30% probability level. Open bonds indicate the disorder component. Symmetry code (A): $-x+2, -y+1, -z+1$.

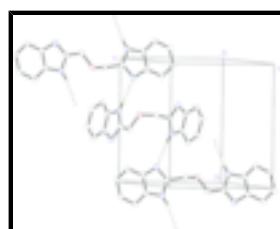

Fig. 2. Part of the crystal structure of the title compound with hydrogen bonds shown as dashed lines. Only H atoms involved in hydrogen bonds are shown. The disorder is not shown.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H atoms treated by a mixture of independent and constrained refinement
$R[F^2 > 2\sigma(F^2)] = 0.043$	$w = 1/[\sigma^2(F_o^2) + (0.0566P)^2 + 0.3224P]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.112$	$(\Delta/\sigma)_{\text{max}} < 0.001$
$S = 1.08$	$\Delta\rho_{\text{max}} = 0.22 \text{ e \AA}^{-3}$
1525 reflections	$\Delta\rho_{\text{min}} = -0.20 \text{ e \AA}^{-3}$
108 parameters	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.015 (3)
Secondary atom site location: difference Fourier map	

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
