Received 21 March 2009; accepted 30 March 2009

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.043; wR factor = 0.124; data-to-parameter ratio = 13.2.

The title compound, $C_{17}H_{14}N_2O$, crystallizes as a *cis* formamide isomer. The isoquinoline and benzene fragments are nearly perpendicular [dihedral angle = 81.79 (18)°], whereas the formamide group is virtually coplanar with the isoquinoline unit [dihedral angle = 1.66 (15)°]. Intermolecular N—H···O hydrogen bonds link molecules into a centrosymmetric dimer.

N-[3-(2-Methylphenyl)isoquinolin-1-yl]formamide

F. N. Cui, J. Q. Li, X. L. Chen and Q. B. Song

Comment

Many of the arylisoquinoline derivatives exhibit potent cytotoxic activities against five different human tumor cell lines (Cho *et al.*, 2002, 2003). The title compound, that belongs to arylisoquinolines, has been synthesized to study its cytotoxic activity and its crystal structure is reported here.

Experimental

A 2.5 *M* solution of n-BuLi in hexanes (54.5 mmol) was added to a solution of the diisopropylamine (59.9 mmol) in THF (5 ml) at 273 K under nitrogen atmosphere. After 10 min, the solution of 2-methylbenzonitrile (36.4 mmol) in THF (5 ml) was added dropwise and the obtained brown reaction mixture was stirred for 1 h, then adding the DMF (18.2 mmol), the mixture was stirred for 2 h at room temperature (Cho *et al.*, 2002; Nunno *et al.*, 2008; Tovar *et al.*, 1999). The mixture was subsequently concentrated under reduced pressure giving the crude product. The residue was recrystallized from ethanol. Colorless crystals of the title compound were obtained by slow evaporation of the solvent after 2 days at room temperature(Yield: 73%, m.p. 401–403 K).

Refinement

All H atoms were placed in calculated posistion with C—H = 0.93 - 0.96 Å, and N—H = 0.86Å and refined in the riding mode aproximation with $U_{iso}(H) = 1.2U_{eq}$ of the carrier atom.

Figures

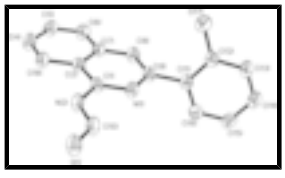

Fig. 1. View of the molecular structure showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 40% probability level. H atoms have been omitted for clarity.

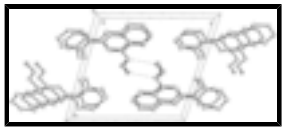

Fig. 2. The molecular packing viewed along the *a* axis. Hydrogen bonds are shown with dashed lines. H atoms are omitted for clarity.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)]$ = 0.043	H-atom parameters constrained
$wR(F^2)$ = 0.124	$w = 1/[\sigma^2(F_o^2) + (0.0578P)^2 + 0.0805P]$ where $P = (F_o^2 + 2F_c^2)/3$
S = 1.03	$(\Delta/\sigma)_{max} < 0.001$
2399 reflections	$\Delta\rho_{max}$ = 0.13 e Å^{-3}
182 parameters	$\Delta\rho_{min}$ = −0.19 e Å^{-3}
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes)

are estimated using the full covariance matrix. The cell e.s.d.'s are taken

into account individually in the estimation of e.s.d.'s in distances, angles

and torsion angles; correlations between e.s.d.'s in cell parameters are only

used when they are defined by crystal symmetry. An approximate (isotropic)

treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
