Received 1 April 2009; accepted 6 April 2009

Key indicators: single-crystal X-ray study; $T = 299$ K; mean $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$; R factor = 0.035; wR factor = 0.127; data-to-parameter ratio = 15.1.

The conformation of the $\text{C}=\text{O}$ bond in the structure of the title compound, $\text{C}_{10}\text{H}_{12}\text{ClNO}$, is *anti* to the $\text{N}-\text{H}$ bond and to the methylene H atoms in the side chain in both the independent molecules comprising the asymmetric unit. However, the conformation of the $\text{N}-\text{H}$ bond is *syn* to the *meta*-methyl substituent in the aromatic ring of one of the molecules and *anti* in the other molecule. The two independent molecules are linked through intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonding into chains parallel to the b axis.

2-Chloro-N-(3,4-dimethylphenyl)acetamide

B. T. Gowda, S. Foro, H. Terao and H. Fuess

Comment

In the present work, as part of a study of the effect of ring and side chain substitutions on the crystal structures of aromatic amides (Gowda *et al.*, 2008a,b,c), the structure of 2-chloro-N-(3,4-dimethylphenyl)acetamide (I) has been determined. The asymmetric unit of the structure contains two molecules (Fig. 1). The conformation of the N—H bond is *syn* to the *meta*-methyl substituent in the aromatic ring of one of the molecules and *anti* in the other molecule. The conformation of the C=O bond in the structure is *anti* to the N—H bond and to the side chain methylene H-atoms in the side chain (Fig. 1), in both the independent molecules comprising the asymmetric unit, similar to that observed in 2-chloro-N-(2,4-dimethylphenyl)acetamide (Gowda *et al.*, 2008a), in 2-chloro-N-(3,5-dichlorophenyl)acetamide (Gowda *et al.*, 2008b), and in 2-chloro-N-(3-methylphenyl)acetamide (Gowda *et al.*, 2008c). The two independent molecules in (I) are linked through intermolecular N—H···O hydrogen bonding (Fig. 1) and the chains formed by H-bonding are parallel to the *b* axis (Table 1, Fig. 2).

Experimental

Compound (I) was prepared according to the literature method (Shilpa & Gowda, 2007). Single crystals were obtained from the slow evaporation of an ethanolic solution of (I).

Refinement

The H atoms were positioned with idealized geometry using a riding model with C—H = 0.93–0.97 Å, N—H = 0.86 Å, and were refined with isotropic displacement parameters (set to 1.2 times of the U_{eq} of the parent atom).

Figures

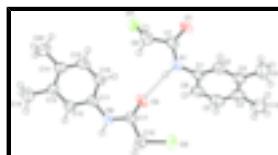

Fig. 1. Molecular structure of (I), showing the atom labeling scheme and displacement ellipsoids drawn at the 50% probability level.

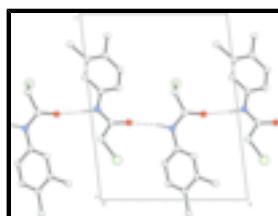

Fig. 2. Molecular packing of (I) with hydrogen bonding shown as dashed lines.

Data collection

Oxford Diffraction Xcalibur diffractometer with a Sapphire CCD detector	3634 independent reflections
Radiation source: fine-focus sealed tube	2874 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.017$
T = 299 K	$\theta_{\text{max}} = 25.4^\circ$
Rotation method data acquisition using ω and ϕ scans	$\theta_{\text{min}} = 2.8^\circ$
Absorption correction: multi-scan (CrysAlis RED; Oxford Diffraction, 2007)	$h = -10 \rightarrow 10$
$T_{\text{min}} = 0.868$, $T_{\text{max}} = 0.936$	$k = -11 \rightarrow 11$
10754 measured reflections	$l = -14 \rightarrow 14$

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.035$	$w = 1/[\sigma^2(F_o^2) + (0.1P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.127$	$(\Delta/\sigma)_{\text{max}} < 0.001$
S = 0.97	$\Delta\rho_{\text{max}} = 0.19 \text{ e \AA}^{-3}$
3634 reflections	$\Delta\rho_{\text{min}} = -0.23 \text{ e \AA}^{-3}$
240 parameters	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.024 (4)
Secondary atom site location: difference Fourier map	

Special details

Experimental. Absorption correction: empirical absorption correction using spherical harmonics, implemented in SCALE3 AB-SPACK scaling algorithm, CrysAlis RED (Oxford Diffraction, 2007).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
