Received 3 April 2009; accepted 6 April 2009

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.001\text{ \AA}$; R factor = 0.037; wR factor = 0.108; data-to-parameter ratio = 28.6.

The molecule of the title oxobutanoate derivative, $\text{C}_{12}\text{H}_{13}\text{ClN}_2\text{O}_3$, is nearly planar; the interplanar angle between the benzene ring and the mean plane through the hydrazone-3-oxobutanoate unit is $2.69(3)^\circ$. An intramolecular N—H···O hydrogen bond generates an $S(6)$ ring motif. In the crystal packing, C—H···O(3-oxo) interactions link molecules into dimers. The dimers thus formed are linked through C—H···O(carboxylate $\text{C}=\text{O}$) interactions, leading to the formation of ribbons along the [011] direction, which are stabilized via $\text{Cl}\cdots\text{Cl}$ [3.2916 (3) Å] contacts. The ribbons are stacked via C···O contacts [3.2367 (12)–3.3948 (12) Å].

Ethyl 2-[(4-chlorophenyl)hydrazone]-3-oxobutanoate

H.-K. Fun, S. Chantrapromma, M. Padaki, Radhika and A. M. Isloor

Comment

Derivatives of oxobutanoates are biologically important. 4-Methylthio-2-oxobutanoate was identified in the culture fluids of a range of bacteria, e.g. the yeast *Saccharomyces cerevisiae* and the fungus *Penicillium digitatum* (Billington *et al.*, 1979). Some oxobutanoates exhibit cytotoxic properties (Stancho *et al.*, 2008). The crystal structure of ethyl 4-chloro-2-[2-(2-methoxyphenyl)hydrazone]-3-oxobutanoate has been reported (Alpaslan *et al.*, 2005).

The molecule of the title oxobutanoate derivative, (I), is nearly planar which can be readily indicated by the interplanar angle between the benzene ring and the mean plane through the hydrazone-3-oxobutanoate unit ($N_1—N_2/O_1—O_3/C_7—C_{10}$) is $2.69(3)^\circ$, and the $C_{10}—C_7—C_8—C_9$ torsion angle of $2.81(15)^\circ$. The ethyl group is slightly deviated from the mean plane of the molecule with the torsion angle $C_{10}—O_3—C_{11}—C_{12}$ being $170.6(9)^\circ$. Within the molecule, an intramolecular $N_1—H_1\cdots O_1$ hydrogen bond generates a S(6) ring motif (Bernstein *et al.*, 1995) (Table 1).

In the crystal packing, the $C_5—H_{5A}\cdots O_1$ interactions link two molecules into a dimer (Table 1 and Fig. 2). The dimers are linked together through $C_2—H_{2A}\cdots O_2$ interactions to form molecular ribbons along the $[01\bar{1}]$ direction; these ribbons are further stabilized by $Cl\cdots Cl$ [$3.2916(3)\text{\AA}$] contacts. These ribbons are stacked, being connected by $C\cdots O$ [$3.2367(12)$, $3.3716(14)$ and $3.3948(12)\text{\AA}$] contacts.

Experimental

Compound (I) was prepared as reported in literature (Amir & Agarwal, 1997). 4-Chloroaniline (1.27 g, 10 mmol) was dissolved in dilute hydrochloric acid (11.0 ml) and cooled to 273 K in an ice bath. To this cold solution, sodium nitrite (1.6 g in 5.0 ml water) was added. The temperature of the reaction mixture was not allowed to raise above 323 K. The resulting diazonium salt solution was then filtered into a cooled solution of ethylacetacetate (1.7 ml) and sodium acetate (3.5 g) in ethanol (50 ml). The resulting yellow solid was filtered, washed with ice-cold water, dried and recrystallized from methanol. The yield was 1.95 g (81%); *M.p.* 365 K.

Refinement

All H atoms were placed in calculated positions with $d(N—H) = 0.91 \text{\AA}$, $d(C—H) = 0.93 \text{\AA}$ for aromatic, 0.97\AA for CH_2 and 0.96\AA for CH_3 atoms. The U_{iso} values were constrained to be $1.5U_{eq}$ of the carrier atom for methyl-H atoms and $1.2U_{eq}$ for the remaining H atoms. A rotating group model was used for the methyl substituents.

supplementary materials

Figures

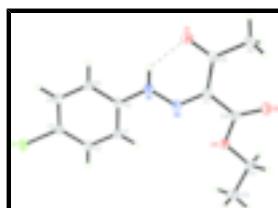

Fig. 1. The structure of (I), showing 50% probability displacement ellipsoids and the atom-numbering scheme. The N—H···O hydrogen bond was drawn as a dashed line.

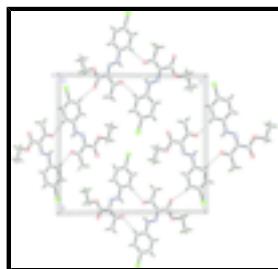

Fig. 2. The packing diagram of (I), viewed along in projection the α axis, showing the arrangement of the dimers into molecular ribbons. C—H···O contacts are shown as dashed lines.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.108$	$w = 1/[\sigma^2(F_o^2) + (0.0602P)^2 + 0.255P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\max} = 0.002$
4723 reflections	$\Delta\rho_{\max} = 0.53 \text{ e \AA}^{-3}$
165 parameters	$\Delta\rho_{\min} = -0.24 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
