Received 13 April 2009; accepted 16 April 2009

Key indicators: single-crystal X-ray study;  $T = 291\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.04\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.052;  $wR$  factor = 0.131; data-to-parameter ratio = 11.2.

The title unsymmetrical tetrathiafulvalene (TTF),  $\text{C}_7\text{H}_2\text{N}_2\text{S}_7$ , contains fused 1,2,5-thiadiazole and 1,3-dithiole rings and is a component molecule for conducting organic solids. The TTF molecule is disordered crystallographically over two orientations related by an inversion center, where each site is half-occupied. The molecule is almost planar with an r.m.s. deviation of  $0.096\text{ \AA}$ . In the crystal structure, molecules are linked by short intermolecular  $\text{S}\cdots\text{S}$  interactions [3.47 (2), 3.507 (8) and 3.517 (13)  $\text{\AA}$ ].

**M. Tomura and Y. Yamashita**

### **Comment**

Tetrathiafulvalene (TTF) derivatives with a fused 1,2,5-thiadiazole ring have received much attention as component molecules for conducting organic solids (Tomura *et al.*, 1993; Underhill *et al.*, 1993; Naito *et al.*, 1996; Tomura & Yamashita, 2003; Tomura & Yamashita, 2004). Intermolecular interactions caused by S···N and S···S heteroatom contacts may increase the dimensionality in solid states and suppress metal-insulator transitions (Williams *et al.*, 1992; Ishiguro *et al.*, 1998). In addition, such interactions may lead to the formation of unique molecular networks which have special functions such as inclusion properties (Yamashita & Tomura, 1998). We report here the molecular and crystal structure of an unsymmetrical TTF derivative (**I**), which contains fused 1,2,5-thiadiazole and 1,3-dithiole rings (Fig. 1).

The center of the unsymmetrical TTF molecule (**I**) is located on an inversion center. Thus, the molecule is disordered crystallographically over two orientations related by the inversion center. Each site is half-occupied and the total site occupation factor (s.o.f.) equals 1.0. This type of disorder was not observed in the crystal of the unsymmetrical tetrathiafulvalene with fused 1,2,5-thiadiazole and 2,3-dihydro-1,4-dioxine rings (Tomura & Yamashita, 2003). Geometric resemblance between 5-membered 1,2,5-thiadiazole and 1,3-dithiole rings causes this disorder in the crystal of (**I**). Superlattice reflection was not observed on CCD images. This fact also suggests crystallographic disorder in the crystal. The molecular framework is almost planar with an r.m.s. deviation of 0.096 Å from the least-squares plane. The [1,3]dithiolo[4,5-*c*][1,2,5]thiadiazole framework (S5/S6/S7/N1/N2/C5/C6/C7) is also planar with an r.m.s. deviation of 0.045 Å, while an r.m.s. deviation for the [1,3]dithiolo[4,5-*d*][1,3]dithiole plane (S1/S2/S3/S4/C1/C2/C3/C4) is large (0.104 Å). The deviations of S3, S4 and C4 atoms from the plane are -0.11 (1), -0.18 (1) and 0.18 (2) Å, respectively. The angle between the two plane is 3.0 (9)°. In the crystal structure, the molecules are linked *via* short intermolecular S···S interactions [3.517 (13) for S3—S4(*x*, -*y*, *z* - 1/2), 3.47 (2) for S5—S6(*x*, -*y*, *z* - 1/2) and 3.507 (8) Å for S7—S7(-*x*, -*y*, -*z*)] (Fig. 2). The S···S interactions are 2.3–3.6% shorter than the sum of the corresponding van der Waals radii (Bondi, 1964). No short intermolecular S···N interaction was observed.

### **Experimental**

The title compound was synthesized according to the literature method (Tomura & Yamashita, 1997). Greenish-brown plates of (**I**) were grown from a toluene solution.

### **Refinement**

The molecule (**I**) was located on an inversion center and was disordered crystallographically over two orientations related by the inversion center. Thus, the occupancy of all atoms was fixed to 0.5. All the H atoms were placed in geometrically calculated positions and refined using a riding model, with C—H = 0.97 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . The refinement was slightly unstable, with some oscillating parameter shifts.

### Data collection

Rigaku/MSC Mercury CCD diffractometer	1639 independent reflections
Radiation source: Rotating Anode	737 reflections with $I > 2\sigma(I)$
Monochromator: Confocal	$R_{\text{int}} = 0.176$
Detector resolution: 14.63 pixels $\text{mm}^{-1}$	$\theta_{\text{max}} = 31.0^\circ$
$T = 291 \text{ K}$	$\theta_{\text{min}} = 3.2^\circ$
$\varphi$ and $\omega$ scans	$h = -39 \rightarrow 35$
Absorption correction: none	$k = -5 \rightarrow 5$
4788 measured reflections	$l = -15 \rightarrow 15$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.052$	H-atom parameters constrained
$wR(F^2) = 0.131$	$w = 1/[\sigma^2(F_o^2) + (0.0051P)^2]$
$S = 0.84$	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} = 0.135$

1639 reflections	$\Delta\rho_{\max} = 0.42 \text{ e \AA}^{-3}$
146 parameters	$\Delta\rho_{\min} = -0.40 \text{ e \AA}^{-3}$
37 restraints	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0064 (8)

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
