School of Chemistry and Chemical Engineering, China West Normal University, Nanchong 637002, People's Republic of China  
 Correspondence e-mail: qindabincnwu@yahoo.com.cn

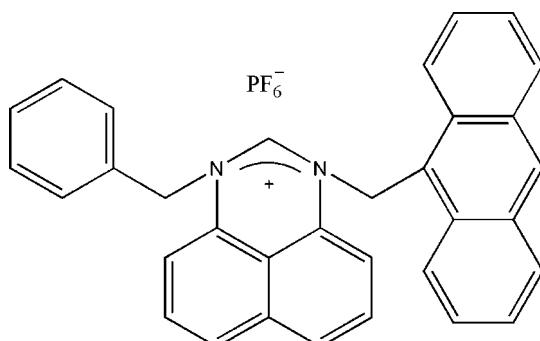

Received 22 April 2009; accepted 6 May 2009

Key indicators: single-crystal X-ray study;  $T = 113$  K; mean  $\sigma(C-C) = 0.003$  Å; disorder in solvent or counterion;  $R$  factor = 0.042;  $wR$  factor = 0.113; data-to-parameter ratio = 11.6.

In the title compound,  $C_{33}H_{25}N_2^+ \cdot PF_6^-$ , the naphthalene ring system is twisted with respect to the anthracene and benzene rings, making dihedral angles of 72.40 (3) and 71.39 (4)°, respectively. The crystal structure is stabilized by intermolecular C–H···F hydrogen bonding. Four F atoms of the hexafluorophosphate anion are disordered over two sets of sites in a 0.645 (4):0.355 (4) ratio.

### 3-(9-Anthrylmethyl)-1-benzylperimidinium hexafluorophosphate

G.-Y. Wang, S.-L. Zhang and D.-B. Qin

#### Comment

In recent years, numerous cyclic N-heterocyclic carbene (NHC) precursors have been synthesized and structurally investigated. They have been recognized as powerful ligands owing to their ability to coordinate very strongly to transition metals and main-group elements and an increasing use in organometallic chemistry, homogeneous catalysis. In addition, a number of biological activities of imidazolium salts have been reported including antimicrobial, antifungal, antitumor. We report here crystal structure of NHC precursor, the title compound.

The molecular structure is shown in Fig. 1. The naphthalene ring system is twisted with the anthracene ring and benzene ring with the dihedral angles of 72.40 (3) $^{\circ}$  and 71.39 (4) $^{\circ}$ . The crystal structure is stabilized by C—H $\cdots$ F hydrogen bonds (Table 1).

#### Experimental

The title compound was prepared according to the procedure reported by Özdemir *et al.* (2004) and Aksenov *et al.* (2008). Yellow single crystals suitable for X-ray diffraction were obtained by recrystallization from acetonitrile.

#### Refinement

H atoms were placed in calculated positions with C—H = 0.95–0.99 Å, and refined in riding mode with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . The four equatorial F atoms (F<sub>2</sub>–F<sub>5</sub>) in the anion PF<sub>6</sub><sup>−</sup> were disordered at two places, occupancies were refined to a 0.645 (4):0.355 (4) ratio.

#### Figures

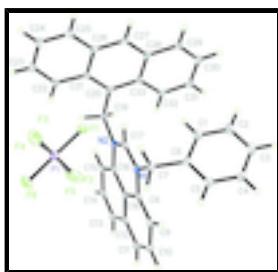

Fig. 1. The molecular structure of the title compound, showing 30% probability displacement ellipsoids and the atomic numbering. The minor component of disordered PF<sub>6</sub><sup>−</sup> has been omitted for clarity.

## Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.042$	H-atom parameters constrained
$wR(F^2) = 0.113$	$w = 1/[\sigma^2(F_o^2) + (0.0672P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{\max} < 0.001$
4823 reflections	$\Delta\rho_{\max} = 0.20 \text{ e \AA}^{-3}$
416 parameters	$\Delta\rho_{\min} = -0.49 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

## Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -

factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and *R*- factors based on ALL data will be even larger.
