Received 31 March 2009; accepted 21 May 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; disorder in main residue; R factor = 0.053; wR factor = 0.176; data-to-parameter ratio = 20.1.

In the title compound, $\text{C}_{24}\text{H}_{25}\text{NO}_7\text{S}$, the sulfonyl-bound phenyl ring is approximately perpendicular to the indole ring system [dihedral angle = $87.72(5)^\circ$]. The methyl group of one of the ester units is disordered over two positions with occupancies of 0.527 (13) and 0.473 (13). An intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bond is observed. In the crystal structure, molecules are linked into a ribbon structure running along the c axis by intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds and $\text{C}-\text{H}\cdots\pi$ interactions involving the pyrrole ring.

Comment

Indoles form an integral part of many natural products and possess potentially reactive sites to perform variety of chemical reactions to generate molecular diversity (Farhanullah *et al.*, 2004). Many of the indole derivatives are found to possess antibacterial (Okabe & Adachi, 1998), antitumour (Schollmeyer *et al.*, 1995) and antimicrobial (El-Sayed *et al.*, 1986) activities.

The bond angles around atom S1 show significant deviation from regular tetrahedral geometry. The widening of O1—S1—O2 [120.42 (11) $^{\circ}$] and the narrowing of the angle N1—S1—C10 [104.43 (9) $^{\circ}$] are attributed to the Thorpe-Ingold effect (Bassindale, 1984). The indole ring system is planar. The bond lengths and angles are comparable to those observed in a related structure (Chakkavarthi *et al.*, 2008). The sum of bond angles around atom N1 (357.9 $^{\circ}$) indicates that the atom N1 is in sp^2 hybridized state (Beddoes *et al.*, 1986). The sulfonyl bound phenyl ring (C10—C15) is approximately perpendicular to the indole ring system, with the dihedral angle being 87.72 (5) $^{\circ}$. The C18—C21/O3/O4 ester group shows an extended conformation, as is evident from the torsion angles C18—C19—O4—C20 = 179.8 (2) $^{\circ}$ and C19—O4—C20—C21 = -169.9 (3) $^{\circ}$. The terminal methyl group of the other ester group is disordered over two positions. An intramolecular C6—H6···O1 hydrogen bond is observed.

In the crystal structure, the molecules are linked into a zigzag C(12) chain running along the *c* axis by intermolecular C—H···O hydrogen bonds involving atoms C14 and O5 (Table 1). The inversion-related molecules of adjacent chains are linked via weak C—H··· π interactions involving the N1/C2—C5 ring (centroid *Cg*1) to form a ribbon structure (Fig. 2).

Experimental

A solution of TiCl₄ (0.37 ml, 3.34 mmol) in dry dichloromethane (DCM; 20 ml) was added drop by drop into dry DCM (10 ml) kept at 273 K and stirred at the same temperature for 45 min. To this, a solution of 5-methoxy-2-methyl-1-(phenylsulfonyl)-1*H*-indole-3-carbaldehyde (0.5 g, 1.52 mmol) and diethylmalonate (0.24 ml, 1.60 mmol) in dry DCM (20 ml) was slowly added. After the addition was completed, the reaction mixture was stirred at 273 K for 1 h. A solution of pyridine (0.6 ml, 6.08 mmol) in dry DCM (20 ml) was then added dropwise for 30 min. The content was stirred at 273 K for 12 h and then at room temperature for 48 h. The reaction mass was quenched with water and extracted with CHCl₃ (2 \times 10 ml). The organic layer was washed with 0.5 *M* HCl (2 \times 20 ml) followed by brine solution (2 \times 20 ml). Removal of solvent followed by flash column chromatographic purification (n-hexane–ethyl acetate 97:3) afforded the title compound as a yellow solid. Single crystals were obtained by recrystallizing the compound from n-hexane–ethyl acetate (97:3).

Refinement

The methyl group at the end of one of ethyl carboxylate chains is disordered over two positions (C24 and C24') with refined occupancies of 0.527 (13) and 0.473 (13). The C23—C24 and C23—C24' bond distances were restrained to be 1.50 (5) Å. The components of the anisotropic displacement parameters of atoms C13, C14, C23 and O6 in the direction of the bond

supplementary materials

between them were restrained to be equal within an effective standard deviation of 0.001. The U^{ij} parameters of atoms C24 and C24' were restrained to an approximate isotropic behaviour. H atoms were positioned geometrically and refined using riding model with C-H = 0.93–0.97 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ and $1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$.

Figures

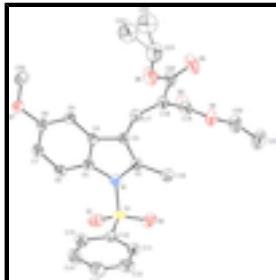

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are drawn at the 20% probability level. H atoms have been omitted for clarity. Both disorder components are shown.

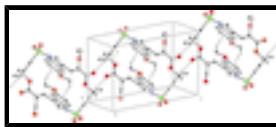

Fig. 2. Crystal packing of the title compound. H atoms not involved in hydrogen bonding (dashed lines) have been omitted.

Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
