Received 20 May 2009; accepted 21 May 2009

Key indicators: single-crystal X-ray study;  $T = 294\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ;  $R$  factor = 0.068;  $wR$  factor = 0.191; data-to-parameter ratio = 13.3.

In the molecule of the title compound,  $\text{C}_9\text{H}_8\text{ClNO}_4$ , the nearly planar acetate moiety [maximum deviation = 0.015 (3)  $\text{\AA}$  for an O atom] is oriented with respect to the plane of the aromatic ring at a dihedral angle of 73.03 (3) $^\circ$ . In the crystal structure, intermolecular C—H $\cdots$ O interactions link molecules into a network.  $\pi$ — $\pi$  contacts between benzene rings [centroid–centroid distance = 4.000 (1)  $\text{\AA}$ ] may further stabilize the structure.

## 4-Nitrobenzyl 2-chloroacetate

K. Zhu, Y.-H. Wang, H. Liu, P.-F. Han and P. Wei

### Comment

Some derivatives of *p*-nitrobenzyl alcohol are important chemical materials. We report herein the crystal structure of the title compound.

In the molecule of the title compound (Fig 1), the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Ring A (C4-C9) is, of course, planar. Atoms N, C3, O3 and O4 are 0.005 (3), 0.027 (3), -0.146 (3) and 0.144 (4) Å away from the ring plane, respectively. On the other hand, (O1/O2/C1-C3) moiety is nearly planar with a maximum deviation of 0.015 (3) Å for atom O2 and it is oriented with respect to ring A at a dihedral angle of 73.03 (3)°.

In the crystal structure, intermolecular C-H···O interactions (Table 1) link the molecules into a network (Fig. 2), in which they may be effective in the stabilization of the structure. The  $\pi$ – $\pi$  contact between the benzene rings, Cg1—Cg1<sup>i</sup> [symmetry code: (i) 1 - x, -y, -z, where Cg1 is centroid of the ring A (C4-C9)] may further stabilize the structure, with centroid-centroid distance of 4.000 (1) Å.

### Experimental

For the preparation of the title compound, chloroacetyl chloride (1.1 g) and *p*-nitrobenzyl alcohol (1.53 g) were added into the mixture of pyridine (15 ml) and dichloromethane (30 ml) at 273–278 K. The gross products were extracted with n-hexane, washed with water, and dried under vacuum, and then recrystallized in dichloromethane (yield: 0.916 g) (Pyun *et al.*, 2001). Crystals suitable for X-ray analysis were obtained by slow evaporation of a methanol solution.

### Refinement

H atoms were positioned geometrically, with C-H = 0.93 and 0.97 Å for aromatic and methylene H, respectively, and constrained to ride on their parent atoms, with U<sub>iso</sub>(H) = 1.2U<sub>eq</sub>(C).

### Figures

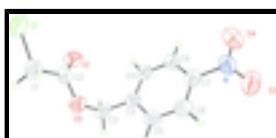

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

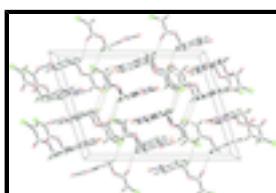

Fig. 2. A partial packing diagram of the title compound. Hydrogen bonds are shown as dashed lines.

Monoclinic, C2/c	Mo K $\alpha$ radiation
Hall symbol: -C 2yc	$\lambda$ = 0.71073 Å
a = 13.636 (3) Å	Cell parameters from 25 reflections
b = 8.1570 (16) Å	$\theta$ = 9–13°
c = 18.878 (4) Å	$\mu$ = 0.38 mm <sup>-1</sup>
$\beta$ = 108.30 (3)°	T = 294 K
V = 1993.5 (8) Å <sup>3</sup>	Block, colorless
Z = 8	0.30 × 0.20 × 0.10 mm

### Data collection

Enraf-Nonius CAD-4	R <sub>int</sub> = 0.055
diffractometer	
Radiation source: fine-focus sealed tube	$\theta_{\text{max}} = 25.3^\circ$
Monochromator: graphite	$\theta_{\text{min}} = 2.3^\circ$
T = 294 K	$h = -16 \rightarrow 0$
$\omega/2\theta$ scans	$k = -9 \rightarrow 0$
Absorption correction: $\psi$ scan (North <i>et al.</i> , 1968)	$l = -21 \rightarrow 22$
$T_{\text{min}} = 0.896$ , $T_{\text{max}} = 0.963$	3 standard reflections
1892 measured reflections	every 120 min
1814 independent reflections	intensity decay: 1%
1132 reflections with $I > 2\sigma(I)$	

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.068$	H-atom parameters constrained
$wR(F^2) = 0.191$	$w = 1/[\sigma^2(F_o^2) + (0.1P)^2 + 2P]$
$S = 1.00$	where $P = (F_o^2 + 2F_c^2)/3$
1814 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
136 parameters	$\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.28 \text{ e \AA}^{-3}$
	Extinction correction: none

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
