Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.006$  Å; disorder in solvent or counterion;  $R$  factor = 0.039;  $wR$  factor = 0.102; data-to-parameter ratio = 16.5.

In the centrosymmetric title compound,  $[Zn_4(C_9H_6NO)_6(C_2H_3O_2)_2] \cdot 2H_2O$ , the  $Zn^{II}$  atom that is bonded to one O atom of the acetate group is chelated by a quinolin-8-olate anion. This Zn atom is also bonded to the oxide O atoms of two other quinolin-8-olate anions, which themselves engage in chelation to the other  $Zn^{II}$  atoms. The  $Zn^{II}$  atom is five-coordinate in a square-pyramidal coordination geometry. The second  $Zn^{II}$  atom is six-coordinate as it is linked to two oxide O atoms of the anions that chelate to the acetate-bound metal atom, and is chelated by two quinolin-8-olate ligands. The uncoordinated water molecule is disordered over two positions in a 4:1 ratio. O—H···O hydrogen bonds between the water molecules and the free O atoms of the carboxylate groups consolidate the crystal packing.

### Experimental

Zinc acetate dihydrate (0.22 g, 0.1 mmol) and 2-methyl-8-hydroxyquinoline (0.14 g, 1 mmol) were loaded into a convection tube. The tube was filled with dry methanol and kept at 333 K. Crystals were collected from the side-arm after a week. The crystals are stable up to 573 K.

### Refinement

Carbon-bound H-atoms were placed in calculated positions (C–H 0.95 to 0.98 Å) and were included in the refinement in the riding model approximation with  $U(H)$  set to 1.2 to 1.5 $U(C)$ .

The water O atom is disordered over two positions in a 4:1 ratio. The two pairs of H atoms were placed in chemically sensible positions on the basis that one of each set forms a hydrogen bond to an acceptor. The O–H distances were fixed at 0.84 Å, and their isotropic temperature factors were tied to those of the O atoms. The anisotropic displacement parameters of the disordered O atoms were restrained to be nearly isotropic.

### Figures

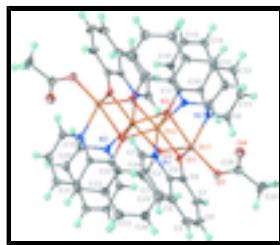

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of  $[Zn_2(C_2H_3O_2)(C_9H_6NO)_3]_2 \cdot 2H_2O$ ; ellipsoids are drawn at the 70% probability level and H atoms with an arbitrary radius. The disordered lattice water molecule is not shown.

## Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.039$	H-atom parameters constrained
$wR(F^2) = 0.102$	$w = 1/[\sigma^2(F_o^2) + (0.0512P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.00$	$(\Delta/\sigma)_{\max} = 0.001$
6146 reflections	$\Delta\rho_{\max} = 0.63 \text{ e \AA}^{-3}$
372 parameters	$\Delta\rho_{\min} = -0.44 \text{ e \AA}^{-3}$
12 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
