Received 2 June 2009; accepted 8 June 2009

Key indicators: single-crystal X-ray study; $T = 90$ K; mean $\sigma(C-C) = 0.009$ Å; R factor = 0.075; wR factor = 0.137; data-to-parameter ratio = 9.8.

The title complex, $[Ni(NCS)_2(C_{18}H_{18}N_4)] \cdot 0.5CH_3OH$, consists of two crystallographically distinct complexes and a methanol solvent molecule. The Ni^{II} complexes are pseudo-octahedral six-coordinate, with the tris(2-pyridylmethyl)amine (TPA) ligand providing four N atoms and two N-bound thiocyanates providing the final two N atoms. The distances and angles are typical for Ni^{II} -TPA complexes. The compound has unit-cell parameters that are surprisingly similar to the previously reported hydrate.

Bis(thiocyanato- κN)[tris(2-pyridylmethyl)amine- κ^4N,N',N'',N''']nickel(II) methanol hemisolvate

S. R. Randeniya and R. E. Norman

Comment

2 [Ni(TPA)(NCS)₂]H₂O was reported previously (Yan, *et al.*, 1999 and Xu, *et al.*, 2003). The Cambridge Crystallographic Data Centre codes for the compound are VILQOW and VILQOW01, Respectively (Allen, 2002). The unit-cell parameters for the hydrate and the methanol solvate are surprisingly similar.

In the latter paper (Xu, *et al.*, 2003) the water of hydration is not mentioned in the discussion of the structure other than an indication of its presence. Figure 1 of that report shows O1 bound to O1', but no details about these oxygen atoms are given. In the CIF for VILQOW, O1' is not listed and O1 corresponds quite well to our O1 and exhibits the same pattern of contacts.

In the current report, there are two crystallographically distinct Ni^{II} complexes and one methanol in the asymmetric unit. The Ni complexes are pseudo-octahedral, 6 coordinate, with TPA providing 4 nitrogen atoms, and the N-bound thiocyanates provide 2 additional nitrogen atoms. The longest nickel-nitrogen bond in each complex involves the tertiary amine of TPA, and the shortest nickel-nitrogen bond in each complex involves the thiocyanate *trans* to the tertiary amine, a pattern seen previously in di- μ -halo-bis{[tris(2-pyridylmethyl)- amine- κ^4N]nickel(II)} bis(triethylammonium) tetraperchlorate where halo is chloro and bromo (Tong, *et al.*, 1999 & Tong, *et al.*, 2000) where the longest nickel-nitrogen bond involves the tertiary amine of TPA and the shortest nickel-halo bond is *trans* to the tertiary amine. The average nickel-pyridyl nitrogen distance (2.074 Å) falls in the lower quartile for similar compounds (2.096 Å, Orpen, *et al.*, 1989). The average nickel-isothiocyanate nitrogen distance (2.064 Å) is the median for similar compounds (Orpen, *et al.*, 1989).

The methanol hydrogen bonds through H1 to the sulfur atom of an adjacent thiocyanate (S22, 1 - *x*, 1 - *y*, -*z*).

Experimental

Tris[(2-pyridinium)methyl]amine perchlorate (0.1954 g, 0.330 mmol) and triethylamine (0.105 ml, 0.75 mmol) were dissolved in 20 ml MeOH. Ni(ClO₄)₂·6H₂O (0.1879 g, 0.501 mmol) and NH₄SCN (0.076 g, 1.0 mmol) were dissolved in 3 ml MeOH and this solution was added to the ligand solution and stirred for 30 minutes. A powdery purple precipitate formed immediately upon mixing the two solutions. The mixture was gravity filtered. The filtrate was allowed to stand undisturbed for two days, and small purple crystals formed.

Refinement

With the exception of the hydrogen atom bound to the methanol oxygen, which was located in a difference map, the hydrogen atoms were placed in calculated positions and refined using a riding model. The position parameters of the hydrogen atom bound to the methanol oxygen were not refined. All hydrogen atoms were assigned thermal parameters 1.2 times larger than the atoms to which they are bound.
