Bis(2,4,6-trimethylphenyl)zinc(II)

Sven Krieck, Helmar Görls and Matthias Westerhausen*

Institute of Inorganic and Analytical Chemistry, Friedrich-Schiller-Universität Jena, August-Bebel-Strasse 2, D-07743 Jena, Germany Correspondence e-mail: m.we@uni-jena.de

Received 15 June 2009; accepted 16 June 2009

Key indicators: single-crystal X-ray study; T = 183 K; mean σ (C–C) = 0.005 Å; disorder in main residue; R factor = 0.071; wR factor = 0.270; data-to-parameter ratio = 19.2.

The title compound, $[Zn(C_9H_{11})_2]$ or Mes₂Zn (Mes = mesityl = 2,4,6-trimethylphenyl), crystallizes with a quarter of a molecule in the asymmetric unit. The Zn^{II} atom is in a strictly linear environment with a Zn–C bond length of 1.951 (5) Å. Due to the imposed 2/m symmetry, both aromatic rings are coplanar. One of the methyl groups is disordered over two equally occupied positions.

Bis(2,4,6-trimethylphenyl)zinc(II)

S. Krieck, H. Görls and M. Westerhausen

Comment

After the first synthesis of dimesitylzinc by Seidel & Bürger (1981), its structure was determined more than 20 years later (Cole *et al.*, 2003). Here we present another modification of this diarylzinc compound.

Whereas dialkylzinc is monomeric diphenylzinc crystallizes as a loose and unsymmetric dimer (Markies *et al.* (1990)). A planar molecule with a strictly two coordinated zinc centre is observed for bis(2,4,6-trimethylphenyl)zinc (dimesitylzinc) by Cole *et al.* (2003). Other substitution patterns of the arene ring also lead to monomeric, but not strictly linear molecules in the solid state. Sun *et al.* (1998) published the structure of bis(pentafluorophenyl)zinc and Brooker *et al.* (1992) reported the structure of bis[2,4,6-tris(rifluoromethyl)phenyl]zinc with a C—Zn—C bond angle of 170°. A The C—Zn—C angle decreases with increasing steric chain and a value of 165.9° was found in bis[2,4,6-tri(*tert*-butylphenyl]zinc by Westerhausen *et al.* (2005).

Experimental

All manipulations were performed in an atmosphere of argon using standard Schlenk techniques. THF and toluene were dried (Na/benzophenone) and distilled prior to use. Mes₂Zn was prepared according to a literature procedure (Seidel & Bürger, 1981). Recrystallization of Mes₂Zn from toluene at +4%C led to the formation of single crystals of the title compound.

Refinement

All hydrogen atoms were set to idealized positions and were refined with 1.2 times (1.5 for methyl groups) the isotropic displacement parameter of the corresponding carbon atom. One of the methyl groups is disordered over two equally occupied positions. The structure contains solvent accessible voids. But the final difference peak of 1.33 e/A^3 is on a special position and could not be related to a solvent molecule.

10286 measured reflections	$l = -6 \rightarrow 5$
1016 independent reflections	

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.071$	$w = 1/[\sigma^2(F_o^2) + (0.1807P)^2 + 0.5133P]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.270$	$(\Delta/\sigma)_{max} < 0.001$
<i>S</i> = 1.13	$\Delta \rho_{max} = 1.33 \text{ e} \text{ Å}^{-3}$
1016 reflections	$\Delta \rho_{min} = -0.60 \text{ e } \text{\AA}^{-3}$
53 parameters	Extinction correction: SHELXL97 (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.041 (11)

Secondary atom site location: difference Fourier map

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*- factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
