Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.037; wR factor = 0.106; data-to-parameter ratio = 14.9.

The title mixed-ligand oxidovanadium(IV) compound, $[\text{VO}(\text{C}_5\text{H}_7\text{O}_2)_2(\text{C}_8\text{H}_9\text{N}_3)]$, contains a V^{IV} atom in a distorted octahedral coordination, which is typical for such complexes. The vanadyl group and the N -heterocyclic ligand are *cis* to each other. The coordination bond is located at the endocyclic N atom of the benzimidazole ligand. Intramolecular hydrogen bonds between the *exo*- NH_2 group H atoms and acetylacetone O atoms stabilize the crystal structure.

Bis(acetylacetonato- κ^2O,O')(2-amino-1-methyl-1*H*-benzimidazole- κN^3)oxidovanadium(IV)

Z. C. Kadirova, D. S. Rahmonova, S. A. Talipov, J. M. Ashurov and N. A. Parpiev

Comment

Vanadium complexes have attracted interest in recent years due to their insulin-mimetic action, and to their activity in nitrogen fixation and haloperoxidation (Rehder, 1999). The vanadium atom can have different coordination numbers and forms coordination compounds with a variety of coordination geometries and oxidation states (Maurya, 2002). Limited information is available on the crystal structure of the vanadium complexes of substituted benzimidazoles (Crans *et al.*, 1997; Maurya *et al.*, 2006). Bis(acetylacetonato)oxovanadium, $[VO(acac)_2]$, is a common precursor for the synthesis of the mixed ligand vanadium(IV) and vanadium(V) complexes with the N-containing monodentate ligands (L), $[VO(acac)_2L]$. Usually these bis-chelated complexes can be *cis*- or *trans*- with distorted octahedral configurations (Caira *et al.*, 1972; Shao *et al.*, 1984). In this study, we prepared the mixed-ligand complex of oxovanadium(IV) with bidentate acetylacetone and the monodentate benzimidazole, 2-amino-1-methylbenzimidazole, and report herein on its crystal structure.

The molecular structure of the title compound is shown in Fig. 1, and geometrical parameters are available from the archived CIF. In this *cis*-complex, $[VO(acac)_2L]$, the metal center has a slightly distorted octahedral N_1O_5 coordination sphere, assembled by the O—O-donor acetylacetone, the oxo-group and the pyridine N-atom of the benzimidazole. The angles around the vanadium atom deviate from 90° , being in the range of $80.85(6)$ - $99.91(7)^\circ$, and from 180° , being in the range of $164.96(7)$ - $179.18(7)^\circ$, due to coordination of the sterically large ligand to the five-coordinate square-pyramidal $[VO(acac)_2]$ complex (Akhmed *et al.*, 2004).

The coordination bond is localized at the *endo*-cyclic N-atom of the benzimidazole ligand and the bond lengths and angles are similar to those reported for 2-amino-1-methylbenzimidazolium chloride hydrate (Borodkina *et al.*, 2003), and bis(2-amino-1-methylbenzimidazole-N) dichlorocobalt(II) (Chekhlov *et al.*, 2004). The amino-group is coplanar with the methyl-group [torsion angle C8A—N2A—C7A—N3A is $4.3(4)^\circ$] and participates in intramolecular hydrogen bonds with the carbonyl O-atoms (Fig. 2 and Table 1).

The V—O bond (V1—O2B) *trans* to the oxo-group is significantly longer ($2.1523(17)$ Å) than the V—O bonds which are *cis* to the oxo-group ($1.9927(14)$ - $2.0139(14)$ Å). In contrast the carbonyl bond involving atom O2B (C4B?O2B) is shorter, ($1.252(3)$ Å), than the other acetylacetone C?O bonds [$1.264(3)$ - $1.273(3)$ Å]. The V—N bond length, the *cis*- and *trans*- V—O bond lengths are comparable to those reported for oxovanadium(IV) species containing $acac^-$ as ligand in a similar orientation (Crans *et al.*, 1997).

Experimental

Equimolar quantities of $[VO(acac)_2]$ ($acac = \text{acetylacetone}$) and 2-amino-1-methylbenzimidazole (0.53 g, 1.9 mmol) were refluxed in ethanol for 3 h. The resulting green solution yielded green crystals which were filtered off and washed twice with acetone. Elem. Analysis found: C 52.4, H 6.0, N 10.3, V 12.4%; $C_{18}H_{23}N_3O_5V$ requires: C 52.4, H 5.6, N 10.2, V 12.4%. IR (BRUKER spectrometer, KBr, cm^{-1}): 3415 s, 3326 s, 1641 s, 1591 s, 1556 s, 1462m, 1373 s, 1273m, 1018m, 1252w,

supplementary materials

1198w, 1132w, 1052*m*, 983*m*, 939*m*, 787w, 746*m*, 669w, 590w, 557w, 455w). Crystals of the title compound, suitable X-ray diffraction analysis, were selected directly from the sample as prepared.

Refinement

All the H-atoms were included in calculated positions [N—H = 0.88 Å, C—H = 0.93 - 0.96 Å] and treated as riding atoms [$U_{\text{iso}}(\text{H}) = k \times U_{\text{eq}}(\text{parent atom})$, where $k = 1.2$ for NH₂ and CH H atoms and 1.5 for methyl H atoms].

Figures

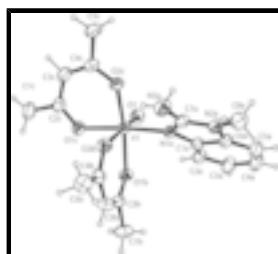

Fig. 1. A view of the molecular structure of the title compound, showing the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

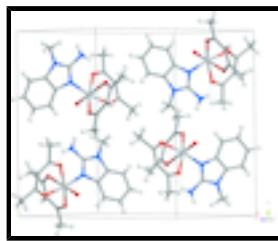

Fig. 2. A view of the crystal packing of the title compound, with the intramolecular N—H···O hydrogen bonds shown as pale blue dashed lines (see Table 1 for details).

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
