Received 14 April 2009; accepted 28 May 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.042; wR factor = 0.129; data-to-parameter ratio = 14.3.

In the title compound, $\text{C}_8\text{H}_{12}\text{O}_4\text{S}$, the two five-membered rings both adopt envelope conformations. In the crystal, weak $\text{C}-\text{H}\cdots\text{O}$ interactions link neighbouring molecules.

Related literature

The title compound is a precursor for the preparation of an important nucleoside drug. For applications of nucleosides in the fields of biology, drugs and chemistry, see: Goodyear *et al.* (2005); Simons (2001); Vittori *et al.* (2006).

Comment

Nucleosides are a very important series of compounds in the fields of biology, drugs and chemistry (Simons, 2001); as an example, lamivudine is used as a drug for HIV and HBV diseases (Goodyear *et al.*, 2005; Vittori *et al.*, 2006). Studies of the synthesis of nucleoside mimetics are essential.

The purpose of this structure determination was to establish the molecular conformation of the title compound obtained by coupling (*R*)-(+)2,2-dimethyl-1,3-dioxolane-4-carboxaldehyde with 2-mercaptopropanoic acid. The chirality at the 2-position (C3) is *R*; this satisfies our requirements for the preparation of corresponding *L*-nucleosides. All bond lengths and bond angles have expected values. The two 5-membered rings both adopt envelope conformations with atoms C3 and C6 at the flap. Three intermolecular C—H···O interactions link neighbouring molecules.

Experimental

A solution of (*R*)-(+)2,2-dimethyl-1,3-dioxolane-4-carboxaldehyde (6.51 g, 50.0 mmol) and 2-mercaptopropanoic acid (4.20 ml, 60.0 mmol) in toluene (200 ml) was heated under reflux for 1.5 h. After the reaction mixture was cooled to room temperature, a saturated aqueous solution of NaHCO₃ (30 ml) was added and these two layers were separated. The organic layer was washed with brine, dried (MgSO₄) and concentrated under reduced pressure. The residue was isolated through short column chromatography on silica gel, which was eluted with EtOAc-petroleum to give the target compound (4.96 g, 48%). m.p. 75–77°C.

50 mg of the final product was dissolved in petroleum ether (5 ml) and the solution was kept at room temperature for 2 days to give colorless single crystals.

Refinement

H atoms were included in the riding model approximation, with C—H distances 0.96–0.98 Å, and with $U_{\text{iso}}(\text{H}) = kU_{\text{eq}}(\text{C})$, where $k = 1.5$ for methyl H and 1.2 for all other H atoms.

Figures

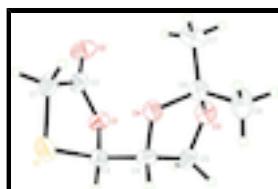

Fig. 1. Molecular structure of the title compound with displacement ellipsoids drawn at the 30% probability level. Hydrogen atoms are drawn as spheres of arbitrary radius.

supplementary materials

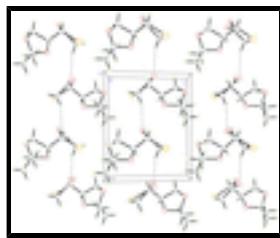

Fig. 2. The crystal packing of the title compound, viewed along the a axis. Hydrogen bonds are shown as dashed lines.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.042$	$w = 1/[\sigma^2(F_o^2) + (0.088P)^2]$
$wR(F^2) = 0.129$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{\text{max}} < 0.001$
1705 reflections	$\Delta\rho_{\text{max}} = 0.24 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.20 \text{ e \AA}^{-3}$

119 parameters	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = k F_c [1 + 0.001 x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$
1 restraint	Extinction coefficient: 0.102 (15)
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 593 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: -0.01 (13)

Special details

Experimental. ^1H NMR(CDCl₃, P.P.M.): 1.41 (d, 6 H), 3.58 (d, 4 H), 3.77 (d, 1 H), 3.92 (dd, 1 H), 4.12 (dd, 1 H), 4.35 (m, 1 H), 5.45 (d, 1 H).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
