Received 27 May 2009; accepted 1 June 2009

Key indicators: single-crystal X-ray study; $T = 294\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.042; wR factor = 0.115; data-to-parameter ratio = 14.1.

In the title compound, $C_{20}H_{15}N$, the fluorene unit is essentially planar [r.m.s. deviation 0.0334 \AA] and the benzene ring bound to the imine N atom bears a methyl group which is nearly coplanar [dihedral angle $0.5(1)^\circ$]. The dihedral angle between the substituent benzene ring and the $9H$ -fluoren-9-imine unit is $71.1(3)^\circ$. Intermolecular $\pi-\pi$ interactions between the benzene rings of adjacent fluorene units [centroid–centroid distance $3.8081(13)\text{ \AA}$] are present in the crystal structure, resulting in a one-dimensional supramolecular architecture.

N-(9H-Fluoren-9-ylidene)-4-methylaniline

S.-Z. Bai, X.-H. Lou, H.-M. Li and H. Shi

Comment

Schiff bases have received much attention during the past decades because of their strong coordination capability and diverse biological activities (Xu *et al.*, 2007; Tanaka *et al.*, 2006). In addition, fluorene derivatives have found many applications in chemistry, especially in the optoelectronic area (Saragi *et al.*, 2004). In view of these important properties, the crystal structure of the title compound has been determined.

In the title compound (Fig. 1), the C12—N1—C14 angle of 120.76 (15) $^{\circ}$ and the N1—C12 bond distance of 1.278 (2) \AA are in close agreement with the similar *N*fluorenylideneaniline (Glagovich *et al.*, 2004; Peters *et al.*, 1998; Pierre *et al.*, 1997). The fluorene unit is essentially planar and the benzene ring bound to the imine N atom bears a methyl that is nearly coplanar. The dihedral angle between the substituent benzene ring and the 9*H*-fluoren-9-imine unit is 108.9 (3) $^{\circ}$. Intermolecular $\pi\cdots\pi$ interactions between the benzene rings of adjacent fluorene units [centroid-centroid distance is 3.8081 (13) \AA , the average perpendicular distance is 3.469 \AA , the dihedral angle between the rings is 3.7 $^{\circ}$, symmetry code = $-1 + x, y, z$] are present in the crystal structure, resulting in a one-dimensional supramolecular architecture (Fig. 2).

Experimental

The title compound was obtained from the condensation reaction of 9-fluorenone and 4-methylaniline as described in literature (Glagovich *et al.*, 2004) and recrystallized from ethanol solution at room temperature to give the desired product as yellow crystals suitable for single-crystal X-ray diffraction.

Refinement

H atoms attached to C atoms of the title compound were placed in geometrically idealized positions and treated as riding with C—H distances constrained to 0.93–0.96 \AA , and with $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$ ($1.5U_{\text{eq}}$ for methyl H).

Figures

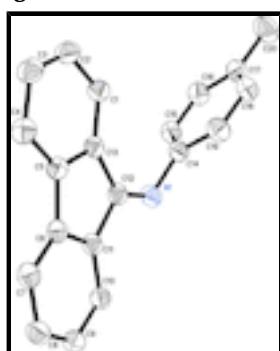

Fig. 1. The molecular structure of the title compound with displacement ellipsoids at the 30% probability level. H atoms are omitted for clarity.

supplementary materials

Fig. 2. Partial view of the crystal packing showing the formation of the chain motif of molecules formed by the intermolecular $\pi\cdots\pi$ interactions. H atoms are omitted for clarity.

Crystal data

C ₂₀ H ₁₅ N	$F_{000} = 568$
$M_r = 269.33$	$D_x = 1.225 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation
$a = 5.6423 (10) \text{ \AA}$	$\lambda = 0.71073 \text{ \AA}$
$b = 12.187 (2) \text{ \AA}$	Cell parameters from 1911 reflections
$c = 21.310 (4) \text{ \AA}$	$\theta = 2.5\text{--}22.3^\circ$
$\beta = 94.441 (2)^\circ$	$\mu = 0.07 \text{ mm}^{-1}$
$V = 1460.9 (5) \text{ \AA}^3$	$T = 294 \text{ K}$
$Z = 4$	Block, yellow
	$0.35 \times 0.17 \times 0.09 \text{ mm}$

Data collection

Bruker SMART APEX CCD area-detector diffractometer	2711 independent reflections
Radiation source: fine-focus sealed tube	1779 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.042$
$T = 294 \text{ K}$	$\theta_{\text{max}} = 25.5^\circ$
phi and ω scans	$\theta_{\text{min}} = 2.5^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -6 \rightarrow 6$
$T_{\text{min}} = 0.976, T_{\text{max}} = 0.994$	$k = -14 \rightarrow 14$
10793 measured reflections	$l = -25 \rightarrow 25$

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.042$	$w = 1/[\sigma^2(F_o^2) + (0.052P)^2 + 0.1725P]$
$wR(F^2) = 0.115$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{\text{max}} < 0.001$
2711 reflections	$\Delta\rho_{\text{max}} = 0.13 \text{ e \AA}^{-3}$
192 parameters	$\Delta\rho_{\text{min}} = -0.14 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: SHELXL, $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{-1/4}$
Secondary atom site location: difference Fourier map	Extinction coefficient: 0.0105 (19)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes)

are estimated using the full covariance matrix. The cell e.s.d.'s are taken

into account individually in the estimation of e.s.d.'s in distances, angles

and torsion angles; correlations between e.s.d.'s in cell parameters are only

used when they are defined by crystal symmetry. An approximate (isotropic)

treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and

goodness of fit S are based on F^2 , conventional R -factors R are based

on F , with F set to zero for negative F^2 . The threshold expression of

$F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is

not relevant to the choice of reflections for refinement. R -factors based

on F^2 are statistically about twice as large as those based on F , and R -

factors based on ALL data will be even larger.
