Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.043;  $wR$  factor = 0.124; data-to-parameter ratio = 27.2.

In the asymmetric unit of the title salt,  $\text{C}_{14}\text{H}_{13}\text{ClN}^+\cdot\text{C}_7\text{H}_7\text{O}_4\text{S}^-$ , there are two crystallographically independent molecules for each component. Each cation adopts an *E* configuration with respect to the  $\text{C}=\text{C}$  bond and is slightly twisted; the dihedral angle between the pyridinium and benzene rings is  $6.53$  ( $7^\circ$ ) for one molecule and  $5.30$  ( $7^\circ$ ) for the other. The methoxy groups in the anion molecules are each twisted from the mean plane of benzene ring with torsion angles of  $16.38$  ( $19^\circ$ ) and  $4.32$  ( $19^\circ$ ). In the crystal structure, the cations are stacked in an antiparallel manner along the *a* axis and the anions are linked together by  $\text{C}-\text{H}\cdots\text{O}$  interactions into a layer parallel to (001). The anion layers are further linked to adjacent cations by  $\text{C}-\text{H}\cdots\text{O}$  interactions.  $\text{C}-\text{H}\cdots\pi$  interactions involving the benzene rings of both ions are also observed.

## 2-[(*E*)-2-(4-Chlorophenyl)ethenyl]-1-methylpyridinium 4-methoxybenzenesulfonate

K. Chanawanno, S. Chantrapromma and H.-K. Fun

### Comment

In search for new organic nonlinear optical (NLO) materials, aromatic compounds with donor and acceptor substituents are extensively studied. Styryl pyridinium derivatives are considered to be promising NLO materials (Cheng, Tam, Marder *et al.*, 1991; Cheng, Tam, Stevenson *et al.*, 1991). During the course of our exploring for new organic NLO materials, we have previously synthesized and reported a number of the crystal structures of pyridinium derivatives (Chanawanno *et al.*, 2008; Chantrapromma, Rodwatharapiban & Fun, 2006; Chantrapromma, Ruanwas *et al.*, 2006; Chantrapromma *et al.*, 2009). The title compound (I) has been synthesized and its crystal structure is reported here as part of our ongoing research on NLO materials. Unfortunately, the title compound crystallized in centrosymmetric space group  $P2_1/c$  and does not exhibit second-order nonlinear optical properties.

The asymmetric unit of (I) contains two crystallographically independent molecules each of the  $C_{14}H_{13}ClN^+$  cation and the  $C_7H_7O_4S^-$  anion which are almost identical (Fig. 1). The cation adopts the *E* configuration with respect to the C14=C15 double bond [1.3429 (19) Å in molecule *A* and 1.3445 (19) Å in molecule *B*] and the torsion angle of C13–C14–C15–C16 = 178.86 (12)° in molecule *A* [178.33 (12)° in molecule *B*]. The molecule of cation is slightly twisted which can be indicated by the dihedral angle between the pyridinium and benzene rings of the cation being 6.53 (7)° in molecule *A* [5.30 (7)° in molecule *B*]. The methoxy group is twisted from the plane of benzene ring of the anion with the torsion angle C7–O1–C6–C5 = -16.38 (19)° in molecule *A* [-4.32 (19)° in molecule *B*]. The bond distances in both cation and anion have normal values (Allen *et al.*, 1987) and comparable with the closely related compounds (Chanawanno *et al.*, 2008; Chantrapromma, Rodwatharapiban & Fun, 2006; Chantrapromma, Ruanwas *et al.*, 2006; Chantrapromma *et al.*, 2009).

In the crystal packing (Fig. 2), all O atoms of the sulfonate group are involved in weak C—H···O interactions (Table 1). The cations and anions are alternately arranged with the cations stacked in an antiparallel manner along the *a* axis and the anions linked together by C—H···O weak interactions (Table 1) into chains along the same direction. The anion chains are further linked to the adjacent cations into ribbons along the *c* axis by C—H···O weak interactions (Table 1). The crystal structure is further stabilized by C—H··· $\pi$  interactions involving the benzene rings (Table 1); *Cg*1, *Cg*2, *Cg*3 and *Cg*4 are the centroids of the C8A–C13A, C8B–C13B, C1A–C6A and C1B–C6B rings, respectively.

### Experimental

2-[(*E*)-2-(4-chlorophenyl)ethenyl]-1-methylpyridinium iodide (0.24 g, 0.67 mmol) was prepared according to the previous report (Chanawanno *et al.*, 2008) and mixed with silver(I) 4-methoxybenzenesulfonate (0.19 g, 0.67 mmol) (Chantrapromma, Rodwatharapiban & Fun, 2006) in methanol solution (100 ml). The mixture solution was stirred for 30 min, the precipitate of silver iodide which formed was filtered and the filtrate was evaporated to give the title compound as an orange solid. Orange block-shaped single crystals of the title compound suitable for X-ray structure determination were recrystallized from methanol by slow evaporation at room temperature over a few weeks (m.p. 476–477 K).

## Refinement

All H atoms were positioned geometrically and allowed to ride on their parent atoms, with  $d(\text{C—H}) = 0.93 \text{ \AA}$  for aromatic and CH, and  $0.96 \text{ \AA}$  for  $\text{CH}_3$ . The  $U_{\text{iso}}$  values were constrained to be  $1.5U_{\text{eq}}$  of the carrier atom for methyl H atoms and  $1.2U_{\text{eq}}$  for the remaining H atoms. A rotating group model was used for the methyl groups. The highest residual electron density peak is located at  $0.79 \text{ \AA}$  from C11A and the deepest hole is located at  $0.61 \text{ \AA}$  from S1A.

## Figures

Fig. 1. The molecular structure of the title compound, with 40% probability displacement ellipsoids and the atom-numbering scheme.

Fig. 2. The crystal packing of the title compound viewed down the  $b$  axis. Weak  $\text{C—H}\cdots\text{O}$  interactions are shown as dashed lines.

11056 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.033$

$\theta_{\text{max}} = 32.5^\circ$

$\varphi$  and  $\omega$  scans  $\theta_{\min} = 2.2^\circ$   
 Absorption correction: multi-scan  $h = -22 \rightarrow 22$   
 (SADABS; Bruker, 2005)  
 $T_{\min} = 0.849$ ,  $T_{\max} = 0.921$   $k = -21 \rightarrow 19$   
 65482 measured reflections  $l = -27 \rightarrow 25$

### Refinement

Refinement on  $F^2$  Secondary atom site location: difference Fourier map  
 Least-squares matrix: full Hydrogen site location: inferred from neighbouring sites  
 $R[F^2 > 2\sigma(F^2)] = 0.043$  H-atom parameters constrained  
 $wR(F^2) = 0.124$   $w = 1/[\sigma^2(F_o^2) + (0.0623P)^2 + 1.6315P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $S = 1.05$   $(\Delta/\sigma)_{\max} = 0.001$   
 13850 reflections  $\Delta\rho_{\max} = 0.97 \text{ e } \text{\AA}^{-3}$   
 509 parameters  $\Delta\rho_{\min} = -0.36 \text{ e } \text{\AA}^{-3}$   
 Primary atom site location: structure-invariant direct methods Extinction correction: none

### Special details

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
