Anton V. Dolzhenko, ${ }^{\text {a }}$ Giorgia Pastorin, ${ }^{\text {a }}$ Anna V. Dolzhenko, ${ }^{\text {a }}$ Geok Kheng Tan ${ }^{\text {b }}$ and Lip Lin Koh ${ }^{\text {b }}$<br> Science Drive 4, Singapore 117543, Singapore, and ${ }^{\mathbf{b}}$ Department of Chemistry,<br>Faculty of Science, National University of Singapore, 3 Science Drive 3, Singapore 117543, Singapore<br>Correspondence e-mail: phada@nus.edu.sg<br>Received 3 June 2009; accepted 10 June 2009<br>Key indicators: single-crystal X-ray study; $T=223 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.062 ; w R$ factor $=0.151$; data-to-parameter ratio $=14.1$.

The title compound, $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{~N}_{12}$, is a centrosymmetric molecule which comprises of a hexaaza[14]annulene macrocyclic ring fused with two pyrazole rings. The macrocyclic ring is essentially planar, with an r.m.s. deviation of 0.0381 A. The electron pairs of the amino groups are delocalized with the conjugated system of the macrocycle. Strong intramolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds arranged in an $S_{2}^{2}(10)$ graph-set motif are present in the macrocyclic ring. In the crystal, the amino groups act as donors for intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ interactions with the N atoms of the heterocyclic system, forming a network of two types of extended chains oriented parallel to the [101] and [011] directions. The crystal packing is also stabilized by weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds formed between pyrazole $\mathrm{C}-\mathrm{H}$ groups and N atoms of the macrocyclic ring, running in the $[10 \overline{1}]$ direction.

## Related literature

## Comment

Macrocyclic compounds, various classes of which have been known for a long time, attract significant attention of the chemists' community due to their unique physico-chemical properties. Several studies on the synthesis and the crystal structure of the planar 1,2,4,8,9,11-hexaaza[14]annulene macrocyclic system have appeared (Gradinaru et al., 2001; Gerbeleu et al., 1991; Leovac et al., 1993; Simonov et al., 1988). However, all of the compounds were prepared and investigated as nickel complexes. Herein, we report the first crystal structure of the ligand with the 1,2,4,8,9,11-hexaaza[14]annulene macrocyclic ring. The title compound is a centrosymmetric molecule, which comprises the hexaaza[14]annulene macrocyclic ring fused with two pyrazole rings. The macrocyclic ring is essentially planar with an r.m.s. deviation of $0.0381 \AA$. The most outlying from the least-squares plane of the marcocyclic ring are atoms C6 (C6A) and N4 (N4A) with deviations of 0.0654 (17) $\AA$ and 0.0577 (18) $\AA$, respectively. The C6-N5 bond distance ( 1.340 (3) $\AA$ ) indicates delocalization of the electron pair of the N5 atom, though the amino group adopts a slightly pyramidal geometry with 0.084 (15) $\AA$ deviation of N5 from the $\mathrm{C} 6 / \mathrm{H} 5 \mathrm{~A} / \mathrm{H} 5 \mathrm{~B}$ mean plane. The strong intramolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds arranged in a $S^{2}(10)$ graph-set motif (Bernstein et al., 1995) are present inside the macrocyclic ring.

In the crystal, the amino groups act as donors for intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ interaction with the nitrogen atoms N1 (N1A) and N6 (N6A), thereby forming two types of extended chains. The nitrogen atoms N1 (N1A) are acceptors in $C(6)$ chains running parallel to the [101] direction, while the nitrogen atoms N6 (N6A) are acceptors in $C(5)$ chains oriented in the [011] direction. Together, these hydrogen bonds form a centrosymmetric $R_{4}^{4}(22)$ motif. The crystal packing is also stabilized by weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, formed between $\mathrm{C} 3-\mathrm{H}(\mathrm{C} 3 \mathrm{~A}-\mathrm{H})$ of the pyrazole rings and nitrogen atoms N6 (N6A) of the macrocyclic ring, running in the [10 $\overline{1}$ ] direction.

## Experimental

The title compound was synthesized according to Dolzhenko et al. (2009). Single crystals suitable for crystallographic analysis were grown by recrystallization from methanol.

## Refinement

All the H atoms attached to the carbon atoms were constrained in a riding motion approximation [0.94 $\AA$ for $\mathrm{C}_{\text {aryl }}-\mathrm{H}$ and $0.97 \AA$ for methyl groups; $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}\left(\mathrm{C}_{\text {aryl }}\right)$ and $\left.U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}\left(\mathrm{C}_{\text {methyl }}\right)\right]$ while the N -bound H atoms were located in a difference map and refined freely.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$ factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.

| N4-C6-N5 | 125.0 (2) |
| N4-C6-C2 | 116.68 (19) |

## sup-4

| $\mathrm{C} 3-\mathrm{C} 2-\mathrm{C} 1$ | $102.91(19)$ | $\mathrm{N} 5-\mathrm{C} 6-\mathrm{C} 2$ | $118.3(2)$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{C} 3-\mathrm{C} 2-\mathrm{C} 6$ | $129.2(2)$ |  |  |

Hydrogen-bond geometry ( $A,{ }^{\circ}$ )

| $D — \mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{~N} 3 — \mathrm{H} 3 \mathrm{~N} \cdots \mathrm{~N} 4$ | $0.85(3)$ | $2.09(3)$ | $2.770(3)$ | $136(2)$ |
| $\mathrm{N} 5 — \mathrm{H} 5 \mathrm{~A} \cdots \mathrm{~N} 1^{\mathrm{ii}}$ | $0.88(3)$ | $2.33(3)$ | $3.065(3)$ | $141(2)$ |
| $\mathrm{N} 5 — \mathrm{H} 5 \mathrm{~B} \cdots \mathrm{~N} 6^{\mathrm{iii}}$ | $0.85(3)$ | $2.61(3)$ | $3.466(3)$ | $174(2)$ |
| $\mathrm{C} 3 — \mathrm{H} 3 \cdots \mathrm{~N} 6^{\text {iii }}$ | 0.94 | 2.51 | $3.402(3)$ | 158 |

Symmetry codes: (ii) $x-1 / 2,-y+3 / 2, z-1 / 2$; (iii) $-x+1 / 2, y-1 / 2,-z+1 / 2$.
