Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$; R factor = 0.063; wR factor = 0.167; data-to-parameter ratio = 10.6.

The title compound, $C_{14}H_{13}N_5$, crystallizes with two crystallographically independent molecules in the unit cell. The two molecules form dimers through intermolecular $\text{N}-\text{H}\cdots\text{N}$ and $\text{C}-\text{H}\cdots\text{N}$ hydrogen bonds. The hydrogen-bonding motifs are $R_2^2(8)$ for both the $\text{N}-\text{H}\cdots\text{N}$ and $\text{C}-\text{H}\cdots\text{N}$ interactions. The pyrazole and pyrimidine rings form dihedral angles of $6.2(3)$ and $8.3(3)^\circ$ with each other and the dihedral angles between the pyrazole and benzene rings are $54.9(2)$ and $58.6(2)^\circ$. The benzene rings of neighbouring dimers also exhibit $\text{C}-\text{H}\cdots\pi$ interactions.

N-(2-Methylphenyl)-6-(1*H*-pyrazol-1-yl)pyridazin-3-amine

A. Q. Ather, M. N. Tahir, M. A. Khan and M. M. Athar

Comment

Pyrazolylpyridazine derivatives are potential anticholesteromic and antihypertensive agents. A docking study of pyrazolylpyridazine has shown inhibitory action against glycogen synthase kinase 3 (Xiao *et al.*, 2006). In continuation of our work on the synthesis and reactions of azolylpyridazines, we have isolated crystals of the title compound, (Fig. 1).

The title compound contains pyrazole, pyridazine and benzene rings. In the asymmetric unit there are two molecules which differ from one another crystallographically.

In one molecule (containing C1—C14), the pyrazole ring is oriented at dihedral angles of 6.16 (30) $^{\circ}$ and 54.91 (21) $^{\circ}$ with the pyridazine and benzene rings, respectively. In the second molecule, the pyrazole ring exhibits dihedral angles of 8.26 (34) $^{\circ}$ and 58.57 (20) $^{\circ}$ with the pyridazine and benzene rings, respectively. Through intermolecular N—H···N and C—H···N hydrogen bonds the two molecules form dimers with hydrogen bonding ring motifs of $R_2^2(8)$ (Bernstein *et al.*, 1995). C—H··· π interactions between the benzene rings are also observed in the structure of the title compound (Table 1, Cg1 is the centroid of benzene ring (C15—C20)).

Experimental

3-Chloro-6-(1*H*-pyrazol-1-yl)pyridazine (1.68 g, 9.33 mmol) and 2-toluidine (1 g, 9.34 mmol) were refluxed in dimethylformamide (DMF) for 2 h. The reaction mixture was concentrated under vacuum and poured in cold water. The precipitates obtained were filtered, washed with distilled water and dried to give 51.28% yield. The product obtained was purified by column chromatography and recrystallized in benzene.

Refinement

In the absence of significant anomalous scattering effects, Friedel pairs were merged. The atoms of one of the benzene rings were refined with equal anisotropic thermal parameters.

H-atoms were positioned geometrically, with N—H = 0.86 Å, C—H = 0.93 and 0.96 Å for aromatic rings and methyl H-atoms and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C}, \text{N})$, where $x = 1.5$ for methyl H and $x = 1.2$ for all other H atoms.

supplementary materials

Figures

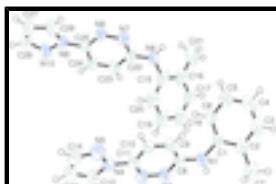

Fig. 1. View of the title compound with the atom numbering scheme. The thermal ellipsoids are drawn at the 50% probability level. H-atoms are shown as small spheres of arbitrary radii.

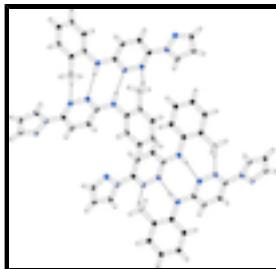

Fig. 2. Packing diagram of the title compound (*PLATON*: Spek, 2009) showing the dimers and ring motifs. Hydrogen bonds are symbolized by dashed lines.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
