Received 15 May 2009; accepted 12 June 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.035;  $wR$  factor = 0.076; data-to-parameter ratio = 16.8.

In the molecule of the title compound,  $\text{C}_7\text{H}_8\text{O}_2$ , the phenol O and hydroxymethyl C atoms lie in the ring plane [deviations of  $-0.015(3)$  and  $0.013(3)\text{ \AA}$ , respectively]. In the crystal structure, intermolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds link molecules into a network. A weak  $\text{C}-\text{H}\cdots\pi$  interaction is also found.

### 4-(Hydroxymethyl)phenol

**W.-S. Liu, R.-P. Wei, X.-L. Tang, W.-H. Wang and Z.-H. Ju**

#### Comment

The reduction of carboxylic acids to alcohols is a key synthetic transformation in organic chemistry. There are several ways to bring about this transformation. It is conventionally carried out using sodium borohydride as a reducing agent. We report herein the crystal structure of the title compound.

In the molecule of the title compound (Fig 1), the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Ring A (C2-C7) is, of course, planar. Atoms O1, O2 and C1 are -0.015 (3), 1.279 (3) and 0.013 (3) Å away from the ring plane, respectively.

In the crystal structure, intermolecular O-H···O hydrogen bonds (Table 1) link the molecules into a network, in which they may be effective in the stabilization of the structure. There also exists a weak C—H···π interaction (Table 1).

#### Experimental

The title compound was prepared by reducing corresponding carboxylic acid using sodium borohydride in THF solution according to a literature method (Tale *et al.*, 2003). Crystals suitable for X-ray analysis were obtained by slow evaporation of an ethyl acetate solution.

#### Refinement

H atoms were positioned geometrically, with O-H = 0.82 Å (for OH) and C-H = 0.93 and 0.97 Å for aromatic and methylene H, respectively, and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C}, \text{O})$ , where  $x = 1.5$  for OH H and  $x = 1.2$  for all other H atoms. The absolute structure could not be determined reliably, and 605 Friedel pairs were averaged before the last cycle of refinement.

#### Figures

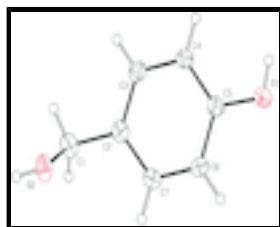

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

#### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.035$	H-atom parameters constrained
$wR(F^2) = 0.076$	$w = 1/[\sigma^2(F_o^2) + (0.0125P)^2 + 0.2042P]$
$S = 1.00$	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} < 0.001$

1414 reflections  $\Delta\rho_{\max} = 0.15 \text{ e \AA}^{-3}$   
 84 parameters  $\Delta\rho_{\min} = -0.16 \text{ e \AA}^{-3}$   
 1 restraint Extinction correction: none  
 Primary atom site location: structure-invariant direct methods

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
