Received 26 June 2009; accepted 6 July 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.030; wR factor = 0.095; data-to-parameter ratio = 15.9.

The asymmetric unit of the title compound, $[\text{Cu}(\text{C}_6\text{H}_{15}\text{NO}_3)\cdot(\text{H}_2\text{O})_2]\text{SO}_4\cdot\text{H}_2\text{O}$, contains a complex cation, a sulfate anion and one uncoordinated water molecule. In the complex cation, the Cu^{II} ion is coordinated by five O atoms (three of which are from the triethanolamine ligand and two from coordinated water molecules) and one N atom of the triethanolamine ligand in a typical Jahn-Teller-distorted octahedral geometry. Classical intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds link the cation, the sulfate anion and the water molecule into a two-dimensional network.

Related literature

Metal-ion-containing supramolecular structures can be used as zeolite-like materials (Venkataraman *et al.*, 1995; Kepert & Rosseinsky, 1999), catalysts (Fujita *et al.*, 1994) and magnetic materials (Kahn, 1993). Diaqua(triethanolamine)copper(II) sulfate monohydrate

H.-X. Guo, S.-K. Huang and X.-Z. Li

Comment

Many workers from a variety of scientific disciplines are interested in the crystal design and engineering of multidimensional arrays and networks containing metal ions as nodes. Metal-ion-containing supramolecular structures can be used as zeolite-like materials (Venkataraman *et al.*, 1995; Kepert & Rosseinsky, 1999), catalysts (Fujita *et al.*, 1994) or magnetic materials (Kahn, 1993). Triethanolamine(TEA)is a good potential ligand to the incorporation of metals into metal-ion-containing supramolecular framework, and many compounds constructed from TEA have been reported in the last decade (Krabbes *et al.*, 2000; Topcu *et al.*, 2001; Ucar *et al.*, 2004; Haukka *et al.*, 2005;Guo *et al.*, 2009). In this work, we employed TEA and CuSO₄ for producing a novel complex, [Cu(C₆H₁₅NO₃)(H₂O)₂].SO₄.H₂O(I).

A view of (I) and its numbering scheme are shown in Fig. 1. The crystal structure consists of a complex cation, one sulfate anion and one lattice water molecue. In the complex cation, the Cu^{II} ion is coordinated by five O atoms, in which three from the TEA ligand and two from coordination water molecules, and one N atom of the TEA ligand in a highly distorted octahedral configuration of the CuNO₅ type, in which The Cu—O bond lengths and O—Cu—N bond angles are in the range of 1.944 (2)–2.389 (2) Å, 80.30 (7)–175.98 (7)°, respectively. and the Cu—N bond length is of 2.033 (2) Å, which is similar to that of the other related compounds(İçbudak *et al.*, 1995; Yeşilel, *et al.*, 2004). The neutral TEA ligand behaves as a tetradentate ligand using all the donor sites (N1, O1, O2 and O3).

In the crystal structure of (I), classical intermolecular O—H···O hydrogen bonds are observed (Table 2), which link the hydroxies, coordinated water molecues of the cation, sulfate anion and lattice water molecue into a two-dimensional hydrogen-bonded network and stabilize the crystal packing (Fig. 2).

Experimental

CuSO₄.5H₂O (0.5002 g, 2 mmol) was dissolved in 10 ml water and the pH was adjusted to 8 with triethanolamine. Blue crystals of (I) separated from the filtered solution at room temperature overseveral days.

Refinement

All H atoms bound to carbon were refined using a riding model with C—H = 0.97 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.Three hydroxy H atoms were located in a difference map and refined with O—H distance restraints of 0.80 (1) Å and with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.The two coordinated water H atoms were located in a difference map and refined with O—H and H···H distance restraints of 0.85 (1) and 1.39 (1) Å, respectively, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$, while the lattice water H atoms were located in a difference map and refined with O—H and H···H distance restraints of 0.84 (1) and 1.39 (1) Å, respectively, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$.

supplementary materials

Figures

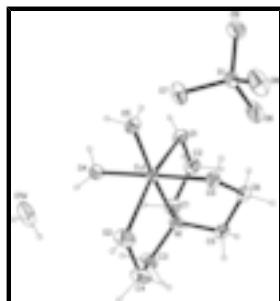

Fig. 1. View of the structure of compound (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 35% probability level; H-atoms are shown as small spheres of arbitrary radius.

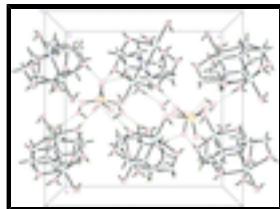

Fig. 2. View of the 2-D hydrogen-bonded network in the packing of the title compound. The packing is viewed along the a axis; O-H \cdots O interactions are shown as dashed lines.

Crystal data

$[\text{Cu}(\text{C}_6\text{H}_{15}\text{NO}_3)(\text{H}_2\text{O})_2]\text{SO}_4 \cdot \text{H}_2\text{O}$	$F_{000} = 1512$
$M_r = 362.84$	$D_x = 1.727 \text{ Mg m}^{-3}$
Orthorhombic, $Pbca$	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Hall symbol: -P 2ac 2ab	Cell parameters from 24803 reflections
$a = 12.502 (3) \text{ \AA}$	$\theta = 3.1\text{--}27.4^\circ$
$b = 14.835 (3) \text{ \AA}$	$\mu = 1.76 \text{ mm}^{-1}$
$c = 15.049 (3) \text{ \AA}$	$T = 293 \text{ K}$
$V = 2791.1 (10) \text{ \AA}^3$	Block, blue
$Z = 8$	$0.46 \times 0.43 \times 0.28 \text{ mm}$

Data collection

Siemens SMART CCD area-detector diffractometer	3180 independent reflections
Radiation source: fine-focus sealed tube	2903 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.036$
$T = 293 \text{ K}$	$\theta_{\text{max}} = 27.4^\circ$
ω scans	$\theta_{\text{min}} = 3.1^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -16 \rightarrow 15$
$T_{\text{min}} = 0.471$, $T_{\text{max}} = 0.619$	$k = -17 \rightarrow 19$
24803 measured reflections	$l = -19 \rightarrow 19$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.030$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.095$	$w = 1/[\sigma^2(F_o^2) + (0.062P)^2 + 2.0253P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{\max} = 0.001$
3180 reflections	$\Delta\rho_{\max} = 0.66 \text{ e Å}^{-3}$
200 parameters	$\Delta\rho_{\min} = -0.53 \text{ e Å}^{-3}$
14 restraints	Extinction correction: SHELXTL (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0166 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
