Received 26 June 2009; accepted 29 June 2009

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; R factor = 0.047; wR factor = 0.122; data-to-parameter ratio = 18.0.

In the title compound, $\text{C}_{15}\text{H}_{12}\text{Br}_2\text{N}_2\text{O}_2$, the molecule adopts an *E* conformation about the $\text{C}=\text{N}$ double bond and a *transoid* conformation about the central $\text{N}-\text{N}$ bond, with a $\text{C}(=\text{O})-\text{N}-\text{N}-\text{C}(\text{H})$ dihedral angle of $169.4(4)^\circ$. In the crystal, molecules are linked by $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds, leading to *C*(4) chains. The packing also features slipped $\pi-\pi$ stacking interactions, with a centroid–centroid separation of $3.838(3)\text{ \AA}$ and a slippage of 1.19 \AA .

2-Bromo-*N'*-[(Z)-2-bromobenzylidene]-5-methoxybenzohydrazide

H. Li, B. K. Sarojini, B. Narayana, H. S. Yathirajan and W. T. A. Harrison

Comment

As part of our ongoing studies of substituted benzohydrazides (Narayana *et al.*, 2007; Butcher *et al.*, 2007) we now describe the synthesis and crystal structure of the title compound, (I) (Fig. 1).

The dihedral angle between the mean planes of the A (C1–C6) and B (C10–C15) rings is 18.6 (3)°. Atom C7 is displaced from the A plane by 0.064 (9) Å. The molecule is significantly twisted about the N1—N2 bond.

In the crystal, an intermolecular N—H···O interaction occurs (Table 2), leading to C(4) chains (Fig. 2) of molecules propagating in [001]. The shortest intermolecular aromatic ring centroid–centroid separation is 3.638 (3) Å, indicative of weak π–π stacking.

Experimental

A mixture of 2-bromobenzaldehyde (1.85 g, 0.01 mol) and 2-bromo-5-methoxybenzo-hydrazide (2.45 g, 0.01 mol) in 15 ml of ethanol containing 2 drops of 4 M hydrochloric acid was refluxed for 3 hours. On cooling, the solid separated was filtered and recrystallized from ethyl alcohol to yield colourless blocks of (I) (m.p: 440–442 K). Analysis (%) for C₁₅H₁₂Br₂N₂O₂: calculated (found): C 43.73 (43.66), H 2.94 (2.91), N 6.80 (6.76).

Refinement

The N-bound H atom was located in a difference map and its position was freely refined. All the other H atoms were placed in idealized locations (C—H = 0.93–0.98 Å) and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$ or $1.5U_{\text{eq}}(\text{methyl C})$. The methyl group was allowed to rotate, but not to tip, to best fit the electron density.

Figures

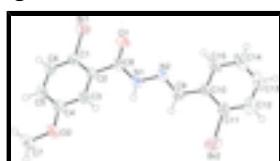

Fig. 1. A view of (I) with displacement ellipsoids for the non-hydrogen atoms drawn at the 50% probability level.

supplementary materials

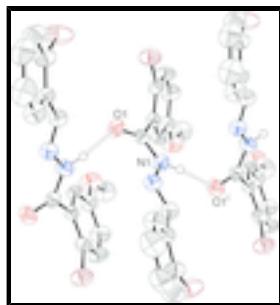

Fig. 2. A fragment of an [001] C(4) chain of molecules in the crystal of (I). Symmetry code as in Table 2.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H atoms treated by a mixture of independent and constrained refinement
$R[F^2 > 2\sigma(F^2)] = 0.047$	$w = 1/[\sigma^2(F_o^2) + (0.0504P)^2]$
$wR(F^2) = 0.122$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.96$	$(\Delta/\sigma)_{\text{max}} = 0.001$
	$\Delta\rho_{\text{max}} = 0.57 \text{ e \AA}^{-3}$

3515 reflections	$\Delta\rho_{\min} = -0.81 \text{ e \AA}^{-3}$
195 parameters	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = k F_c [1 + 0.001 x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0145 (10)
Secondary atom site location: difference Fourier map	

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
