Received 25 June 2009; accepted 1 July 2009

Key indicators: single-crystal X-ray study; $T = 90$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.029; wR factor = 0.076; data-to-parameter ratio = 14.4.

In the crystal of the title compound, $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_4\text{S}$, molecules are linked into chains by a series of intermolecular $\text{O}-\text{H}\cdots\text{O}$, $\text{N}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds. The ninhydrin and aminothiazolidine units make a dihedral angle of $66.41(3)^\circ$. The crystal structure indicates the presence of equimolar R and S enantiomers in the crystal lattice, due to the presence of a chiral centre in the title compound.

Related literature

The NADPH-dependent oxidase activity of 2-indol-3-yl-methylenequinuclidin-3-ols has been reported by Sekhar *et al.* (2003) and novel substituted (*Z*)-2-(*N*-benzylindol-3-ylmethylene) quinuclidin-3-one and (*Z*)-(\pm)-2-(*N*-benzylindol-3-ylmethylene) quinuclidin-3-ol derivatives have been identified as potent thermal sensitizing agents (Sonar *et al.*, 2007). The crystal structure and bond-length data for ninhydrin have been described by Medrud (1969) and Fun *et al.* (2009).

Comment

In continuing studies on the design and synthesis of novel radiosensitizers such as (*Z*)-2-(*N*-benzylindol-3-ylmethylene)quinuclidin-3-one and (*Z*)-(\pm)-2-(*N*-benzylindol-3-ylmethylene) quinuclidin-3-ol derivatives (Sekhar *et al.*, 2003; Sonar *et al.*, 2007), we have undertaken the design, synthesis and structural analysis of a series of ninhydrin analogs with a variety of active methylene compounds. The X-ray analysis of the title compound was carried out to confirm stereochemistry and to obtain detailed information on the structural conformation of the molecule, that might be useful in structure-activity relationship (SAR) studies. The title compound was prepared by the condensation of ninhydrin with 2-aminothiazol-4(*5H*)-one in ethanol at reflux temperature. The compound was crystallized from ethanol. The molecular structure and the atom-numbering scheme are shown in Fig. 1. The ninhydrin ring is planar (r.m.s. deviation = 0.0255 (10) Å) with bond distances and angles comparable with those previously reported for ninhydrin (Medrud, 1969 and Fun *et al.* (2009)). The title compound has a chiral centre at C₁₀ and the X-ray data indicate that the compound is racemic (Fig. 2). The ninhydrin and 2-aminothiazol-4(*5H*)-one moieties make a dihedral angle of 66.41 (3)°. Intermolecular O—H \cdots O, N—H \cdots O and N—H \cdots N hydrogen bonds stabilize the crystal structure, and form a three-dimensional network.

Experimental

A mixture of ninhydrin (1 mmol) and 2-aminothiazol-4(*5H*)-one (1.1 mmol) was stirred under reflux in ethanol for 6 hrs. After the reaction was complete, the reaction mixture was cooled to room temperature. The precipitate thus obtained was collected by filtration, washed with cold ethanol and dried, to afford the crude product. Crystallization from ethanol afforded a light yellow crystalline product of 2-(2-amino-4-oxo-4,5-dihydrothiazol-5-yl)-2-hydroxy -1*H*-indene-1,3(2*H*)-dione that was suitable for X-ray analysis. ¹H NMR (DMSO-*d*₆): δ 5.01 (*s*, 1H, CH), 7.10 (*s*, 1H, OH), 7.93–8.03 (*m*, 4H, Ar—H), 8.94–9.06 (*bd*, 2H, NH₂), p.p.m.; ¹³C NMR (DMSO-*d*₆): δ 62.15, 73.62, 123.47, 123.57, 136.67, 137.26, 140.68, 141.09, 182.49, 185.12, 197.48, 198.25 p.p.m..

Refinement

H atoms were found in difference Fourier maps and subsequently placed in idealized positions with constrained distances of 1.00 Å (*R*—CH), 0.95 Å (C—H), 0.84 Å (O—H), 0.88 Å (N—H), and with *U*_{iso}(H) values set to either 1.2*U*_{eq} or 1.5*U*_{eq}(OH) of the attached atom.

Figures

Fig. 1. A view of the molecule with the atom numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. Crystal packing of the molecule viewed along the *a* axis. H atoms have been omitted for clarity.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
