Received 6 July 2009; accepted 8 July 2009

Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  $R$  factor = 0.055;  $wR$  factor = 0.110; data-to-parameter ratio = 8.2.

Crystals of the title compound,  $\text{C}_{57}\text{H}_{85}\text{N}_9\text{O}_9\cdot\text{CH}_4\text{O}$ , the methanol solvate of a nine peptide polypeptide, *cyclo*-(Pro-Pro-Phe-Leu-Ile-Ile-Leu-Val), were obtained after separation of the cyclic peptide from flax oil. The cyclolinopeptide A (CLP-A) molecules are linked in chains along the  $a$  axis by N–H···O hydrogen bonds. Each methanol O atom is hydrogen bonded to one O atom and two N–H groups in the same CLP-A molecule. There are a total of eight hydrogen bonds in each CLP-A–MeOH unit.

## Cyclolinopeptide A methanol solvate

J. W. Quail, J. Shen, M. J. T. Reaney and R. Sammynaiken

### Experimental

The title compound was extracted from flax oil by successive elution of a mixture of 700 ml of flax oil and 700 ml of 5% ethyl acetate in hexane. Fractions containing several cyclic peptides were collected and dried by rotary evaporation. Further separation was achieved by using HPLC and acetonitrile/water solvent gradient. Each cyclic peptide fraction was collected and identified by NMR and MS. CLP-A was crystallized by dissolving it in minimum amount of methanol and then adding a few drops of water to the solution. After two days of slow evaporation of the methanol at room temperature, suitable crystals were harvested for crystallographic studies.

### Refinement

H atoms bonded to N atoms were located in a difference map and then positioned geometrically with  $U_{\text{iso}}$  constrained to be 1.2 times  $U_{\text{eq}}(\text{N})$  and the bond length constrained to 0.88 Å. Other H atoms were positioned geometrically and refined using a riding model (including free rotation for methyl groups with C—H = 0.95–0.99 Å and with  $U_{\text{iso}}(\text{H}) = 1.2(1.5$  for methyl groups) times  $U_{\text{eq}}(\text{C})$ ).

The chirality of the amino acids can not be determined from the anomalous dispersion, but the relative chirality is clearly all the same. The structure has no atom with  $Z>8$ . With Mo radiation and low resolution data, it is impossible to determine the absolute chirality from these data. Based on the synthesis of the molecule by Prox & Weygand (1966), we have assumed that all amino acids are S. All Friedel mates (4536) were merged in the refinement.

### Figures

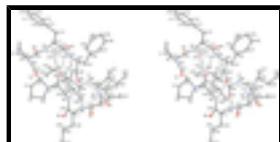

Fig. 1. The stereo molecular structure of the title compound, with atom labels and 20% probability displacement ellipsoids for non-H atoms. Only H atoms on N or O atoms are included. The methanol molecule (C58—O10) has the C atom pointing toward the viewer.

## Data collection

Nonius KappaCCD diffractometer	5817 independent reflections
Radiation source: fine-focus sealed tube	3987 reflections with $I > 2\sigma(I)$
Monochromator: horizontally mounted graphite crystal	$R_{\text{int}} = 0.070$
Detector resolution: 9 pixels mm <sup>-1</sup>	$\theta_{\text{max}} = 25.0^\circ$
$T = 173$ K	$\theta_{\text{min}} = 2.5^\circ$
$\varphi$ scans and $\omega$ scans with $\kappa$ offsets	$h = -11 \rightarrow 11$
Absorption correction: none	$k = -26 \rightarrow 26$
10352 measured reflections	$l = -31 \rightarrow 31$

## Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.055$	$w = 1/[\sigma^2(F_o^2) + (0.0289P)^2 + 2.503P]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.110$	$(\Delta/\sigma)_{\text{max}} < 0.001$
$S = 1.04$	$\Delta\rho_{\text{max}} = 0.18$ e Å <sup>-3</sup>
5817 reflections	$\Delta\rho_{\text{min}} = -0.18$ e Å <sup>-3</sup>
707 parameters	Extinction correction: SHELXTL (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0040 (3)
Secondary atom site location: difference Fourier map	Absolute structure: syn

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
