Correspondence e-mail: kurt.mereiter@tuwien.ac.at

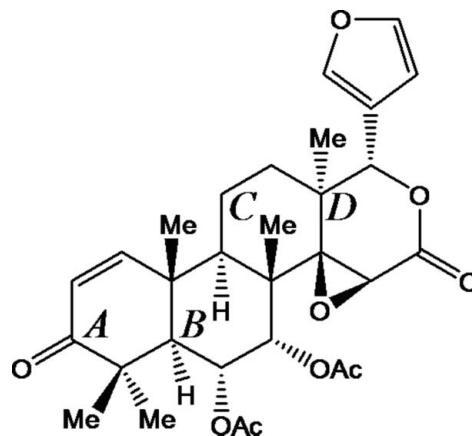

Received 14 July 2009; accepted 16 July 2009

Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.037;  $wR$  factor = 0.099; data-to-parameter ratio = 12.6.

The title compound [systematic name: (1*S*,3a*S*,4a*R*,4b*S*,5*S*,6*R*,6a*R*,10a*R*,10b*R*,12a*S*)-5,6-bis(acetoxy)-1-(3-furyl)-1,5,6,6a,7,10a,10b,11,12,12a-decahydro-4*b*,7,7,10a,12a-pentamethyl-oxireno[*c*]phenanthro[1,2-*d*]pyran-3,8(3*aH*,4*bH*)-dione],  $C_{30}H_{36}O_9$ , is a limonoid-type triterpene isolated from *Aglaia elaeagnoides* (A. Juss.) Benth. (Meliaceae) from Queensland, northern Australia. It contains the gedunin core of four *trans*-fused six-membered rings with an oxirane ring annelated to the fourth ring. A terminal 3-furyl unity and two acetoxy groups in a mutual *cis*-disposition supplement the molecule. A comparison between the gedunin cores of the title compound, the parent compound gedunin, and three further gedunin derivatives revealed considerable variations in their conformation stemming from the conformational lability of the first screw-boat ring and the third twist-boat ring. A sensitive measure for the third ring is one C—C—C—C torsion angle, which is  $14.2(2)^\circ$  in the title compound, but varies in other cases from *ca* 20 to *ca*  $-40^\circ$ . In the crystalline state, 6*a*-acetoxygedunin shows ten comparatively weak C—H···O interactions, with H···O distances in the range of 2.33–2.69 Å.

## 6 $\alpha$ -Acetoxygedunin

M. Hofer, H. Greger and K. Mereiter

### Comment

The genus Aglaia of the family Meliaceae has received scientific attention due to its bioactivity potential. Besides its unique chemical capacity to produce flavaglines with pronounced insecticidal, antifungal, and anticancer activities (Greger *et al.*, 2001; Engelmeier *et al.*, 2000; Hausott *et al.*, 2004), Aglaia is also characterized by the accumulation of bisamides, lignans, and triterpenes (Greger *et al.*, 2000). However, in contrast to other genera of that family the highly active triterpenoid limonoids appear to be rare in Aglaia only known so far from *Aglaia elaeagnoidea* collected in Sempu Island, Java, Indonesia (6 $\alpha$ ,11 $\beta$ -diacetoxygedunin; Fuzzati *et al.*, 1996), but not from samples collected in India and Thailand (Brader *et al.*, 1998). Our investigation of the root bark of *Aglaia elaeagnoidea* originating from northern Australia led now to the second isolation of a limonoid from this genus, namely the title compound 6 $\alpha$ -acetoxygedunin. This compound was previously isolated from several other genera of the Meliaceae family, such as *Guarea grandiflora* Decne.ex Steud. (Jimenez *et al.*, 1998) or *Carapa guianensis* Aubl. (Lavie *et al.*, 1972), but its crystal structure has not been determined as yet.

6 $\alpha$ -Acetoxygedunin contains the gedunin skeleton with four six-membered rings (A, B, C, D), which are all *trans*-fused and adopt screw-boat, chair, twist-boat, and twisted half-chair conformation, respectively (Fig. 1). The D-ring, a lactone, is stiffened by fusion with an oxiran ring and bears in equatorial position a furan ring in approximately perpendicular orientation to the main plane of the molecule. Bond length and angles are normal (*cf.* geometric parameters) and compare well with the parent compound gedunin (Toscano *et al.*, 1996), which is devoid of the 6-acetoxy group O2—(C27O8)—C28H<sub>3</sub>, and with three more gedunin derivatives, 11 $\alpha$ -hydroxygedunin (Mitsui *et al.*, 2006), 11 $\beta$ -hydroxygedunin (Mitsui *et al.*, 2006), and 7-oxogedunin (Waratchareeyakul *et al.*, 2004; 7-acetoxy group replaced by a carbonyl oxygen with concomitant change of C7 from *sp*<sup>3</sup> to *sp*<sup>2</sup> hybridization). However, the torsion angles within the A/B/C/D rings of these five compounds show in part considerable variations and consequently the molecular conformations as well. This is visualized by three superposition plots of 6 $\alpha$ -acetoxygedunin and its congeners shown in Figures 2 to 4. Fig. 2 demonstrates that 6 $\alpha$ -acetoxygedunin and 11 $\alpha$ -hydroxygedunin (Mitsui *et al.* 2006; it contains two independent molecules) have relatively closely matching conformations of their A/B/C/D rings. Fig. 3 compares 6 $\alpha$ -acetoxygedunin and gedunin showing that their B, C, and D rings match very well, but that the A-rings display a significant mismatch. The torsion angle T1 = C3—C4—C5—C10 may be used as a qualitative measure for this match/mismatch: It is 30.7 (2) $^{\circ}$  in 6 $\alpha$ -acetoxygedunin and 51.2 $^{\circ}$  in gedunin, while the remaining three gedunin-type compounds have T1 angles between 32.2 $^{\circ}$  (11 $\alpha$ -hydroxygedunin) and 45.3 $^{\circ}$  (7-oxogedunin). Fig. 4 demonstrates that the most outstanding difference in conformation exists between 6 $\alpha$ -acetoxygedunin and 7-oxogedunin. This difference does not arise from the unlike hybridization of C7 (*sp*<sup>3</sup> in title compound and *sp*<sup>2</sup> in 7-oxogedunin), but is clearly provoked by ring C, which switches from a twist-boat conformation in 6 $\alpha$ -acetoxygedunin *via* a virtual boat-intermediate into a twist-boat conformation of opposite twist in 7-oxogedunin. This can be tracked by the torsion angle T2 = C9—C11—C12—C13, which is +14.2 (2) $^{\circ}$  in 6 $\alpha$ -acetoxygedunin (+21.6 $^{\circ}$  in gedunin; +9.5 $^{\circ}$  and +14.5 $^{\circ}$  for the two independent molecules in 11 $\alpha$ -hydroxygedunin), while it is -38.9 $^{\circ}$  in 7-oxogedunin and -20.7 $^{\circ}$  in 11 $\beta$ -hydroxygedunin. The described variations come essentially from the fact that B- and D-rings behave hard (B-ring in a relaxed and essentially invariant chair-conformation, D-ring in a twisted half-chair conformation fixed by oxiran ring and lacton group) while A-rings (screw-boat) and C-rings (between boat and twist-boat) behave soft and labile in conformation. The

## supplementary materials

---

soft parts of the molecules are certainly controlled by the steric requirements of the ring substituents and by the crystal packing with its interplay of intra- and intermolecular forces. In the title compound  $6\alpha$ -acetoxygedunin such forces involve only several quite weak intra- and inter-molecular C—H $\cdots$ O interactions, which are listed in Table 1. For a packing diagram of  $6\alpha$ -acetoxygedunin, see Fig. 5.

### Experimental

Air-dried root bark of *Aglaia elaeagnoidea* (28 g) collected at the shore near Port Douglas, Queensland, northern Australia, was ground and extracted with MeOH at room temperature for 3 days, filtered and concentrated. The CHCl<sub>3</sub> fraction (1.2 g) of the aqueous residue was roughly separated by column chromatography (Merck Si gel 60, 35–70 mesh) eluted initially with hexane enriched with EtOAc, followed by an increasing amount of MeOH in EtOAc and finally with MeOH. The fraction eluted with 50% EtOAc in hexane was further separated by repeated preparative MPLC (400 x 40 mm column, Merck LiChroprep silica 60, 25–40  $\mu$ m, UV detection at 229 and 254 nm) using 5% 2-propanol in hexane yielding 15 mg of impure  $6\alpha$ -acetoxygedunin from which 3.8 mg of crystals could be obtained.

The resonances of the <sup>1</sup>H and <sup>13</sup>C NMR spectra of the title compound were assigned by two-dimensional NMR (H/H COSY, NOESY, HMBC, HMQC) and relevant literature for  $11\beta$ -acetoxygedunin (Connolly *et al.*, 1966) and gedunin (Taylor, 1974). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>,  $\delta$ /p.p.m.): 7.41 (d, 1H, J = 1.3 Hz, 21-H), 7.41 (d, 1H, J = 1.3 Hz, 23-H), 7.07 (d, 1H, J = 10.1 Hz, 1-H), 6.33 (t, 1H, J = 1.3 Hz, 22-H), 5.94 (d, 1H, J = 10.1 Hz, 2-H), 5.61 (s, 1H, 17-H), 5.27 (dd, 1H, J = 12.4 and 2.4 Hz, 6-H), 4.89 (d, 1H, J = 2.4 Hz, 7-H), 3.61 (s, 1H, 15-H), 2.53 (m, 1H, 9-H), 2.52 (d, 1H, J = 12.4 Hz, 5-H), 2.15 (s, 3H, 7-OAc), 2.03 (s, 3H, 6-OAc), 1.60, 1.35, 1.30, and 1.10 (m, 1H each, 11-H2 and 12-H2), 1.27 (s, 3H, 26-H3), 1.26 (s, 3H, 24-H3), 1.24 (s, 3H, 18-H3), 1.21 (s, 3H, 19-H3), 1.17 (s, 3H, 25-H3). <sup>13</sup>C NMR (CDCl<sub>3</sub>,  $\delta$ /p.p.m.): 204.1 (s, C-3), 170.1 and 170.0 (s, 6- and 7-acetyl CO), 167.1 (s, C-16), 156.2 (d, C-1), 143.1 (d, C-23), 141.2 (d, C-21), 126.6 (d, C-2), 120.3 (s, C-20), 109.8 (d, C-22), 78.1 (d, C-17), 72.6 (d, C-7), 69.7 (d, C-6), 69.5 (s, C-14), 56.2 (d, C-15), 47.8 (d, C-5), 44.9 (s, C-4), 43.1 (s, C-8), 40.6 (s, C10), 48.8 (s, C-13), 38.4 (d, C-9), 31.6 (q, C-24), 25.9 (t, C-12), 21.4 (q, C-19), 21.2 (q, 6-acetyl CH<sub>3</sub>), 20.9 (q, 7-acetyl CH<sub>3</sub>), 20.2 (q, C-25), 18.1 (q, C-26), 17.9 (q, C-18), 15.0 (t, C-11).

### Refinement

All C-bound H atoms were placed in calculated positions (C—H = 0.95–1.00 Å) and thereafter treated as riding. A torsional parameter was refined for each methyl group.  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$  were applied. The absolute structure could not be determined from the X-ray analysis, but it is known from earlier work on related compounds (*e.g.* Sutherland *et al.*, 1962). Friedel pairs were therefore merged before final refinement.

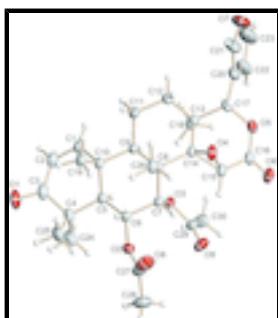

**Figures**

Fig. 1. The structure of the title compound, showing 50% probability displacement ellipsoids and the atom-numbering scheme.

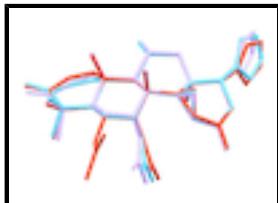

Fig. 2. Superposition plot of the title compound (red) and 11 $\alpha$ -hydroxygedunin (Mitsui *et al.*, 2006; two independent molecules in blue and pink) after least squares fit of the A/B/C/D rings.

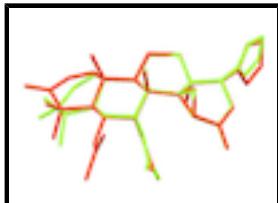

Fig. 3. Superposition plot of the title compound (red) and gedunin (Toscano *et al.*, 1996; green) after least squares fit of the B/C/D rings. The distance between the two terminal keto oxygen atoms O(1) (leftmost red and green atom) is 2.01 Å.

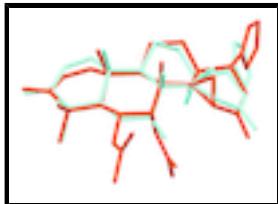

Fig. 4. Superposition plot of the title compound (red) and 7-oxogedunin (Waratchareeyakul *et al.*, 2004; cyan) after least squares fit of the A/B/C/D rings. Note the difference in torsion angle T2 = C9—C11—C12—C13 (upper part of ring C), which is +14.2 (2) $^{\circ}$  in 6 $\alpha$ -acetoxymycedunin and -38.9 $^{\circ}$  in 7-oxogedunin.

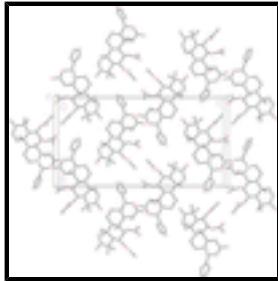

Fig. 5. Packing diagram of 6 $\alpha$ -acetoxymycedunin viewed down the  $\alpha$  axis.

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
